All Rights Reserved

Printed in Canada

Information is subject to change without notice. Nortel Networks reserves the right to make changes in design or components as progress in engineering and manufacturing may warrant. This equipment has been tested and found to comply with the limits for a Class A digital device pursuant to Part 15 of the FCC rules, and the radio interference regulations of Industry Canada. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses and can radiate radio frequency energy, and if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at their own expense.

SL-1 and Meridian 1 are trademarks of Nortel Networks.

Revision history

April 2000

Standard 5.00. This guide combines the three Option 11C Planning and Installation guides for the UK, *NTP 553-3021-210UK*, Europe, *NTP 553-3021-210EU* and North America, *NTP 553-3021-210*, into one global document for Release 25.0x.

May 1999

Issue 4.00, Standard

March 1998

Issue 3.00, Standard

This guide is reissued to include X11 Release 23.30 information and other miscellaneous updates.

October 1997

Issue 2.00, Standard

The *General Information and Planning Handbook (553-3021-200)*, Standard 1.0 and the *Installation Guide (553-3021-210)*, Standard 1.0 were combined to form the ***Planning and Installation Guide***. Also contained were sections (those pertaining to a **new** installation) from the *Software Installation Program Guide (553-3021-310)*, Standard 1.0. Updates and requirements for Release 23 (ISM changes) were also included.

July 1996

Issue 1.00, Standard

About this guide

The *Planning and Installation Guide (553-3021-210)* is intended for Meridian 1 Option 11C new system planning and installation personnel.

This Nortel Networks technical publication (NTP) is a useful reference tool for first-time installations as it provides valuable information for the planning and installation of the Option 11C system. The planning chapters describe the general design, features, limits, and site requirements of the Option 11C system. The installation chapters give complete installation instructions and outlines the process of installing a new Option 11C main cabinet system and expansion cabinets, if required.

IMPORTANT

If performing a new installation of an Option 11C system, follow the procedures described in this guide. If upgrading from an Option 11 or 11E to an Option 11C system, follow the steps outlined in the *Option 11C Upgrade Procedures* guide.

Detailed technical information is contained in the optional *Option 11 Technical Reference Guide*.

Chapter 1 — Overview of the Option 11C

General information

This chapter provides an overview of the Option 11C system applicable for first-time installations. It covers general design and features as well providing unique system information.

Design and architecture

The Option 11C is a small wall- or floor-mounted digital system which can be configured as a system with up to five cabinets.

Up to four expansion cabinets can be connected to the main cabinet using copper or fiber optic cable. The expansion cabinets can be located up to 3 km (1.8 mi) from the main cabinet.

Option 11C Mini chassis can also be connected to Option 11C Main cabinets. Please refer to the *Option 11C Mini Expansion Guide, NTP 553-3021-208*, for more information.

Call processing, serial ports and network traffic are handled by an MC68040 processor located on the Small System Controller (SSC) card in the main cabinet. Processing is significantly increased in comparison with previous Option 11 systems.

The Option 11C uses global software found in other members of the Meridian 1 family. It can be configured as a key system or as a Private Branch Exchange (PBX).

Line cards and trunk cards used in the Option 11C are the same as those used in other Meridian 1 systems, with the addition of some specially designed cards used in the Option 11C system.

The Option 11C can be configured as a non-blocking system as it does not need to be provisioned for speech paths or timeslots.

Easy to install and program

The system is shipped with a Software Daughterboard which is pre-configured with system and customer data.

The Software Installation Program is automatically invoked during first-time installation of the Option 11C system. This is a menu driven program which installs the software and makes the Option 11C operational.

Model telephones

The user has a variety of pre-programmed model telephone layouts from which to choose. Using telephone layouts or templates, technicians can perform a few simple steps at installation to activate multiple telephones.

Administration telephone

If the default model layouts for telephones and trunk routes are used, an administrative telephone is all that is required to make adjustments to such things as the numbering plan and access codes. A TTY input terminal is not required for programming the Option 11C unless a custom layout is used.

The telephones used for administrative functions can be an M2616, M2008 or M3900 digital telephone. These phones can also double as a user's working telephone.

Changing or removing pre-programmed data

If the pre-programmed data is not applicable to users at a particular site, the data can be revised on-site with a TTY, or remotely over a modem connection. If desired, the user can start with the minimal amount of data required for initial software programming which is the configuration record. This step must be performed while the user is in the Software Installation Program.

Set-Based Administration

The Set-Based Administration feature simplifies system installation and administration by enabling a telephone set to perform several administrative and maintenance procedures. Examples such as changing data associated with specific set-related features, or changing Calling Party Name Display on a particular set, can be performed through the Set-Based Administration feature.

For more information about Set-based Administration, refer to the *X11 System Management Application Guide*, NTP 553-3001-303.

Multiple-terminal access

The Option 11C allows a total of five users access to log in, load, and execute overlays simultaneously. For example, if you have expansion cabinets, users can access the system through the Main or Expansion cabinets at the same time.

Three Serial Data Interface (SDI) ports are provided on the Main cabinet's Small System Controller (SSC) card, while each expansion cabinet can be accessed through one SDI port on each Expansion cabinet Fiber Receiver card.

The advantage of multiple-terminal access is that it allows for more efficient programming and maintenance of the Option 11C, especially when system cabinets are located up to 3 km (1.8 mi) apart.

Meridian Mail

The specially designed Meridian Mail comes pre-configured with mailboxes already setup for pre-programmed extensions. If the numbering plan is being modified, then the mailboxes can be changed from any TTY used for Option 11C administration.

Fully featured

Option 11C comes with software for applications such as Automatic Call Distribution, Voice Mail, Automatic Route Selection, Automatic Set Relocation, and Attendant Administration, to name a few.

The Meridian Mail application comes equipped standard with features like Voice Menus, Automated Attendant, and Hospitality Voice Services.

Meridian Mail Networking is available on advanced Meridian Mail systems.

There is a choice of software available offering everything from General Business features to Advanced Applications. First-time installations are performed from the Software Daughterboard that is initially provided with the new system. Upgrades to new software releases are performed using a Software Delivery card (PCMCIA card).

Unique Option 11C elements

The Option 11C system is characterized by the following unique elements:

- Software Delivery card (PCMCIA)
- Flash Drives (primary and backup)
- Software Daughterboard
- Security Device which validates keycodes for features assigned to this system.

Software Delivery card

The Option 11C uses a Software Delivery card (PCMCIA card) to upgrade system software and to provide storage for a backup copy of customer data.

The Software Delivery card is inserted in a specially designed socket in the faceplate of the NTDK20 Small System Controller (SSC) card. Once inserted, software and customer databases can be loaded from the card to the Flash Drive daughterboard on the NTDK20 Small System Controller (SSC) card.

Chapter 2 — Equipment identification

General information

This chapter identifies the major components of the Option 11C system that are pertinent to installation. Identification codes are given where appropriate.

Cabinets

The NTAK11 Cabinet is used for both main and expansion cabinets. The cabinet faceplate has been updated as illustrated in Figure 1 below.

Figure 1
NTAK11 Cabinet

The Main cabinet houses the Small System Controller (SSC) card and can be connected to up to four Expansion cabinets to increase the line capacity of the system. Each cabinet provides ten additional Intelligent Peripheral Equipment (IPE) slots to the system.

Cable connectors

Connectors for cables to the cross-connect terminal are found at the bottom of each cabinet.

The AUX, SDI and Ethernet connectors are located at the bottom left-hand side of the cabinets. The AUX port connects auxiliary equipment such as a Power fail transfer unit (PFTU) to the Option 11C in each cabinet. The SDI connector in the main cabinet interfaces three SDI ports using a three-port SDI cable. In expansion cabinets, the SDI connector interfaces with one SDI port. The Ethernet connector in the main cabinet provides a 10 Mbps Ethernet port.

Cooling

The NTAK11 cabinet is designed to permit natural convection cooling.

CAUTION

Make sure ventilation to the cabinets is not obstructed.

Power supplies

Two types of power supply are available for the system:

- The NTDK78 AC/DC power supply (see Figure 2 on page 19)
- The NTDK72 DC power supply is used when the cabinet is powered by a -52 V dc source.

Figure 2
AC/DC power supply

Reserve power

CAUTION

If the NTDK78 AC/DC power supply is powered down while it is operating on DC reserve power from a battery backup unit, the Option 11C system cannot be powered up again until AC power is restored. Be careful not to open the circuit breaker, either on the battery backup unit or on the NTDK78, while the system is operating on battery backup.

Three types of reserve battery power can be used with the Option 11C system:

- The NTAK75 battery box (shown in Figure 3 on page 20) provides a minimum of two hours of reserve DC power.

Figure 3
NTAK75 battery box

- The NTAK76 battery box (shown in Figure 4 on page 21) provides a minimum of 15 minutes of reserve DC power.
- An Uninterruptible Power supply (UPS) for continuous AC power supply is also permissible.

Note: Customer-supplied battery backup units can be connected to the cabinets using an NTAK28 Junction Box.

Figure 4
NTAK76 battery box

Common equipment circuit cards

The circuit cards described in this section are used in the Option 11C Main cabinet.

NTDK20 Small System Controller (SSC) card and components

Software Daughterboards

Three versions of Software Daughterboard may be used:

- The NTDK81 provides 40 Mb of memory.
- The NTDK13 provides 48 Mb of memory.
- The NTDK21 provides 40 Mb of memory.

Fiber Daughterboards

There are five types of Fiber Expansion Daughterboards; three single port and two dual port:

- The NTDK22 Single Port Fiber Expansion Daughterboard (10m).
- The NTDK24 Single Port Fiber Expansion Daughterboard (3 km, multi-mode).
- The NTDK79 Single Port Fiber Expansion Daughterboard (3 km, single-mode).
- The NTDK84 Dual Port Fiber Expansion Daughterboard (10m).
- The NTDK85 Dual Port Fiber Expansion Daughterboard (3 km, multi-mode).

Security Device

The NTDK20 SSC card is equipped with a socket designed to accommodate the Security Device shipped with each new Option 11C system. The Security Device is normally not attached to the SSC card when it is shipped. It must be attached to the SSC card during initial installation procedure. See Figure 5 on page 25.

PCMCIA interface

The NTDK20 SSC card has a 2-slot PCMCIA interface socket located on its faceplate. The socket can accommodate a Software Delivery card used primarily for software upgrades on existing Option 11C systems. It can also be used for creating an external backup copy of the customer data base.

Fiber Expansion interfaces

The Option 11C Main cabinet can be connected to;

- up to two expansion cabinets using single port Fiber Expansion Daughterboards.
- up to four expansion cabinets using dual port Fiber Expansion Daughterboards.

The Fiber Expansion Daughterboards are mounted on the on the NTDK20 SSC card (see Figure 5 on page 25). Each port on the Fiber Expansion Daughterboard also provides an additional 16 channels of conferencing capabilities.

SDI ports

The NTDK20 SSC card contains three SDI ports used to connect on-site terminals or remote terminals through a modem. The default settings on the ports are as follows:

Table 1
SDI port default settings

TTY Port	Baud rate	Data bits	Stop bits	Parity
0	Set by a DIP switch	8	1	None
1	1200 (Note)	8	1	None
2	1200(Note)	8	1	None
Note: The baud rate shown for ports 1 and 2 is the default rate. Ports 1 and 2 can be configured in software to a maximum baud rate of 19200 bps.				

Ethernet interface

The NTDK20 SSC card is equipped with a 10 Mbps Ethernet port. External connection to the Ethernet port is provided by a 50 pin connector located in the main cabinet. An NTDK27 Ethernet Adaptor Cable adapts this 50 pin connector to the standard 15 pin AUI interface for a MAU.

Note: The Ethernet interface uses the same connector as the copper expansion connector (NTAK04). Therefore, it can be used only on systems with a Main cabinet or Main cabinet and fiber expansion cabinets.

Conferencing

Thirty conference channels are provided by the NTDK20 SSC card. Conference capability is increased when Fiber Expansion Daughterboards are added to the NTDK20 SSC card to connect to expansion cabinets, see Figure 5 on page 25. Each port on the Fiber Expansion Daughterboard increases the total number of conference channels by 16.

Digitone Receiver, tone generation, tone detection functions

The NTDK20 SSC card provides the following Digitone and other tone related functions:

- 30 channels of tone and digit switch (TDS) and a combination of eight Digitone receivers (DTR) or dial tone detectors (XTD)
- Tone service ports which can be configured as either four units of MFC/MFE/MFK5/MFK6/MFR or eight DTR/XTD units.

An NTAK03 card can be installed in the main cabinet if additional tone receiver and transmission resources are required.

Figure 5
Daughterboards and Security Device on the NTDK20 SSC card

NTAK02 SDI/DCH card

This optional SDI/DCH card provides four SDI ports for various applications.

NTAK03 TDS/DTR card

Provides tone transmission and detection plus two SDI ports.

NT5K20 and NT5K48 Tone detector Cards

Provide DTMF or DT detection.

ISDN and Digital Trunk Interface

Network Equipment also includes Digital Trunk Interface (DTI) and Primary Rate Interface (PRI) cards. A Clock Controller is required if connecting to digital trunks. ISDN PRI connections require a D-channel handler interface as well.

For more information about ISDN and network equipment, refer to the following NTPs:

- *Option 11 1.5 DTI/PRI Administration and Maintenance Guide*, NTP 553-3011-310
- *Option 11 2.0 DTI/PRI Administration and Maintenance Guide*, NTP 553-3011-315
- *Option 11 SDN BRI Guide*, NTP 553-3011-311

Fiber Expansion equipment

Fiber Receiver card

Multi-cabinet Option 11C systems require a Fiber Receiver card in each Expansion cabinet. There are three versions of the Fiber Receiver card. Each connects to a corresponding Fiber expansion Daughterboard:

- the NTDK23 (10m),
- the NTDK25 (3km, multimode)
- NTDK80 (3k, singlemode).

Fiber Expansion Daughterboard

Single Port Fiber Expansion Daughterboard

The Single Port Fiber Expansion Daughterboards and their Fiber Receiver counterparts are:

- The NTDK22 Fiber Expansion Daughterboard connects to one NTDK23 Fiber Receiver card using a 10m plastic fiber cable.
- The NTDK24 Fiber Expansion Daughterboard connects to one NTDK25 Fiber Receiver card using glass fiber cable.
- The NTDK79 Fiber Expansion Daughterboard connects to one NTDK80 Fiber Receiver card using glass fiber cable.
- The NTDK84 Fiber Expansion Daughterboard connects to one or two NTDK23 Fiber Receiver cards using a 10m plastic fiber cable.
- The NTDK85 Fiber Expansion Daughterboard connects to one or two NTDK25 Fiber Receiver cards using glass fiber cable (up to 3 km in length).

Figure 6
The NTDK22 Daughterboard

Figure 7
The NTDK24 Daughterboard

Dual Port Fiber Expansion Daughterboard

The Dual Port Fiber Expansion Daughterboards and their Fiber Receiver counterparts are:

- The NTDK84 Dual Port Fiber Expansion Daughterboard connects to the NTDK23 Fiber Receiver card using 10m plastic fiber cable.

Figure 8
The NTDK84 Daughterboard.

- The NTDK85 daughterboard connects to the NTDK25 Fiber Receiver card using glass fiber cable (up to 3 km in length).

Figure 9
The NTDK85 Daughterboard

Routing Guide

Each cabinet in a multi-cabinet system requires a Routing guide in order to route and manage the fiber optic cable. Only one guide is required in each cabinet.

There are two types of Routing guides used in cabinets equipped with an NTDK20 SSC:

- The P0816832 Fibre Routing guide can be used in main cabinets equipped to support a maximum of two expansion cabinets or in expansion cabinets.
- The P0888475 Cable Routing guide, required to support three or four expansion cabinets, is supplied with new systems. It is also compatible with systems when one or two expansion cabinets are being used and in expansion cabinets.

Peripheral equipment cards

The following Intelligent Peripheral Equipment (IPE) cards can be used in the Option 11C system. Both the Main cabinet and Expansion cabinets can accommodate these IPE cards.

- NT1R20 Off-Premise Station (OPS) Analog line card
- NT8D02 Digital line card
- NT8DO9 Analog message waiting line card
- NT8D14 Universal Trunk card
- NT8D16 Digitone Receiver card.
- NT8D15 E&M Trunk card
- NT5K02 (International) Analog line card
- NT5K18 (International) 8 Port COT/PPM Trunk card
- NT5K17 (International) 8 Port DID Trunk card
- NT5K19 (International) 4 Port 2W/4W E&M, RAN, Paging AC15 trunk card
- NT5K21 (International) Multi Frequency Compelled Sender/Receiver card
- NT5K36 (International) 4 Port German DID/DOD Trunk card
- NT7D16 Data Access card (DAC)
- NTAG26 Extended Multi-frequency Receiver (XMFR) card

Telephones and attendant console

The following is a list of the telephones supported by Option 11C:

- Analog (500/2500 type) Telephones with or without message waiting lamps
- Meridian Digital Telephones (M2006, M2008, M2009, M2018, M2112, M2216, M2616, M3000 and M3901)
- M2616 or M2216 Central Answering Position (CAP). This telephone must be equipped with an ACD LCD display in order to function as a CAP telephone.
- Meridian 2250 (TCM) attendant consoles, Attendant PCs.

Cables and wires

Table 2
Cable and wire specifications

Cables and wires	Purpose/description
A0317094 power cord	Connects a system cabinet to a 110 V ac commercial power source Length: 9 ft 10 in. (3000 mm).
A0391685 power cord	Connects a system cabinet to a 220 V ac commercial power source Length: 9 ft 10 in. (3000 mm).
NTDK27 Ethernet adaptor cable	Provides a 15-pin AUI ethernet interface.
A0632902 Fiber Optic cable (multi-mode plastic)	Connects a Main and Expansion cabinet by interfacing with an expansion daughterboard and a Fiber Receiver card. Length: 10 m (33 ft)
Glass Fiber Optic (multi-mode or single mode, depending on interface) cable up to 3 km (1.8 mi)	Must be supplied locally by a facilities provider. Length up to 3 km (1.8 mi)
NTAK0420 power cable	Connects a system cabinet to a reserve battery power supply, or to a DC power source in conjunction with an NTA028 Junction box.
- table continued -	

Table 2 (Continued)
Cable and wire specifications

Cables and wires	Purpose/description
NTAK1104 AUX cable	Connects a PFTU to a system cabinet, and provides power to an M2250 attendant console.
NTBK48 three-port SDI cable	Connects TTYs, modems, and so on, to Option 11C. It is used in conjunction with the NTDK20 card.
NTAK1118 one-port SDI cable	Connects TTYs, modems, and so on, to Fiber Receiver card supported SDI ports in the expansion cabinets. The cable provides a 9-pin to 25-pin converter connection.
NTAK19EC cable	Two-port SDI cable used with the NTAK03 circuit card.
NTAK19FB cable	Four-port SDI cable used with the NTAK02 circuit card.
A0601397 F-F DCE to DTE converter, or A0601396 F-M DCE to DTE converter	May be required when connecting SDI ports to TTYs, modems, etc.
NTBK04 1.5 Mb DTI/PRI carrier cable (A0394216)	Connects the NTAK09 1.5 Mb DTI/PRI card to the Channel Service Unit (CSU). Brings Tx and Rx pairs to a standard 5 pin connector.
NTBK05CA coax cable NTBK05DA twisted pair cable NTAK10 2.0 Mb DTI cable NTAK79 2.0 Mb PRI cable NTAK50 2.0 Mb PRI cable	Provides DTI/PRI connections. Brings Tx and Rx pairs to a standard 5 pin connector.
NE-A25B 25-pair cable	Connects peripheral equipment cards to cross-connection terminals. NE-A25B connector slots are located on the bottom of each cabinet.
#6 AWG (#40 Metric Wire Gauge) insulated ground wire	Connects a system cabinet to a building ground source.
Cross-connecting wire	Makes cross-connections at the cross-connect terminal.

Glass fiber optic cable requirements

The Option 11C fiber optic link for distances up to 3 km (1.8 mi) uses the industry standard 62.5/125 μm glass multi-mode duplex cable or 9/125 μm glass Single Mode duplex cable with ST-type connectors.

The type of cable used depends on the type of installation and any local building codes.

Table 3 on page 34 lists the optical requirements for glass fiber optic cable used with the Option 11C.

Table 3
Multi and Single Mode glass optical cable requirements for distances up to 3 km (1.8 mi)

Parameter	Minimum	Typical	Maximum	Units
Glass Fiber Cable Length			3.0	km
Cable Attenuation @1300 nm		1.5 (multi-mode) 0.5 (Single Mode)	2.0 (multi-mode) 0.7 (Single Mode)	dB/km
Modal Bandwidth @1300 nm	200	500		MHz * km
Chromatic Dispersion @1300 nm		6		ps / nm * km
Typical 3dB Optical Bandwidth		180		MHz * km

Note: The fiber link is limited to a maximum length of 3 km. To guarantee reliable operation a bandwidth of 150% should be maintained. If the link is increased beyond the 3 km length the 150% margin is deteriorated possibly resulting in link malfunction under some conditions.

Miscellaneous items

The following is a list of typical miscellaneous items that can be used as part of the system installation. Quantities needed depend on the site and customer requirements:

- QUA6 Power fail transfer units (PFTU) to transfer lines during a power or system failure
- modems or Data Communication Equipment (DCE) for remote access to the system
- on-site Data Terminating Equipment (DTE) or teletypewriter (TTY) terminal for accessing the system
- connecting blocks for the cross-connect terminal
- transformers and centralized power supplies for items such as digit displays on telephones
- optional equipment such as music sources, RAN machines, paging equipment and CDR devices
- NTAK92 Off-Premise Protection module for connecting up to four off-premise analog telephones
- additional Modem Eliminator (NULL Modem without hardware handshaking) A0601397 converter may be required to interface the DTE to the system.

Chapter 3 — System and site requirements

General information

Before installing the Option 11C system, take some time to plan the installation to ensure the system performs correctly.

Make sure that the site meets all of the following environmental, grounding, power, and cross-connect terminal requirements before proceeding with the installation.

Environmental requirements

The Meridian 1 Option 11C system is designed to operate in an office environment that meets the following general conditions:

- The room is clean and well ventilated. Each cabinet can dissipate up to 500 Watts of power in the form of heat (1700 BTU [1800 kJ] per hour). Equipment room ventilation must be sufficient to maintain the temperature at an acceptable level.
- The temperature is maintained between:
 - 0° and 45° C (32° and 113° F) when the cabinets are mounted side-by-side.
 - 0° and 35° C (32° and 95° F) when the cabinets are mounted one above the other.
- The humidity is maintained between 5% and 95% non-condensing.
- The location selected to mount the equipment is not subject to constant vibration.

- The equipment is located at least 12 ft (3660 mm) away from sources of electrostatic, electromagnetic or radio frequency interference. These sources may include:
 - power tools
 - appliances (such as vacuum cleaners)
 - office business machines (such as copying machines)
 - all electric motors
 - electrical transformers.

Earthquake bracing requirements

IMPORTANT

The following earthquake bracing guidelines conform to the requirements for the state of California specifications in the U.S.A.

The guidelines recommend that the installer mount the cabinets on a wall using a sheet of 3/4 in. (20 mm) plywood as a backboard. The plywood should be secured to the wall with a minimum of six fasteners. (Refer to Table 5 on page 39 for a description of appropriate fasteners.)

Table 4 identifies the maximum allowable wall height in earthquake prone areas for various types of stud wall construction.

Table 4
Minimum wall requirements – stud construction

Wall Studs	Spacing off center	Maximum Height of Wall
2 in. x 4 in. wooden studs	16 in. or 24 in.	10 ft
2 in. x 6 in. wooden studs	16 in. or 24 in.	16 ft
3 5/8 in. 20 gauge metal studs	16 in. or 24 in.	12 ft
3 5/8 in. 18 gauge metal studs	16 in. or 24 in.	16 ft

Table 5
Minimum fastener requirements

Type of wall	Fasteners	
Wooden studs	#10 wood screws	Minimum 1 in. embedment in wood studs
Metal studs	# 14 sheet metal screws	Minimum 1 in. embedment in metal studs
Concrete (2000 PSI)	1/4 in. HILTI KB-II	Minimum 1 1/8 in. embedment
Masonry	1/4 in. Ramset Redhead Dynabolt sleeve anchor	

The mounting bracket for each cabinet should be fastened to the sheet of plywood with the five, 1 in. #14 screws supplied with the bracket.

A detailed procedure for earthquake bracing is included in “Chapter 6 – Bracing cabinets against earthquakes” on page 87 of this book.

Grounding requirements

WARNING

Failure to follow grounding recommendations may result in an installation that is:

- unsafe for personnel working on, or using the equipment
- not properly protected from lightning or power transients
- subject to service interruptions

Grounding requirements

Before installing an Option 11C and applying AC power, measure the impedance of the building ground reference. (An ECOS 1023 POW-R-MATE or similar meter is suitable for this purpose.) If the ground path connected to the Option 11C has an impedance of 5 Ohms or more, better grounding arrangements should be made. Any improvements to the grounding system should be made before the Option 11C is installed.

Other grounding requirements are as follows:

- The impedance of the link between the ground post of the system cabinets and the Single Point Ground (SPG) to which it is connected must be less than 0.25 Ohms.
- Never connect the single point ground conductor from the Option 11C system to structural steel members or electrical conduit. In particular, never tie this conductor to a ground source or grounded electrode that is not hard-wired to the building reference conductor.
- Ground conductors for the Option 11C system:
 - must not be smaller than #6 AWG (#40 metric) at any point
 - must be routed through the same conduit as the phase conductors serving the system
 - must not be smaller than any phase conductor in the same conduit
 - do not carry current under normal operating circumstances.
- All ground conductors in the building:
 - must be isolated from the neutral bus except at the service entrance to the building
 - must be hardwired to the main ground reference.
- Avoid spliced conductors. Continuous conductors have lower impedance and are more reliable than spliced ones.

- All conductors must be terminated in a permanent manner. Ensure all terminations are easily visible and accessible for maintenance purposes.
- Tag ground connections clearly with a message such as “CRITICAL CONNECTION: DO NOT REMOVE OR DISCONNECT”.

CAUTION

Once the Option 11C is installed, the impedance of the link between the ground post of the main cabinet and the single point ground to which it is connected must be less than 0.25 Ohms.

CAUTION

Reliable Option 11C operation depends on high-precision internal circuitry, which can be damaged by transients in its supply conductors and ground system. Damage to sensitive devices due to transients may not be immediately apparent: degradation may occur over longer periods of time.

Ground bus isolation

It is permitted in the USA under the exception to article 384-20 in the NEC to isolate a panel’s ground bus from the housing, provided the panel concerned is not at the main service entrance. This is also permitted in some Canadian locations. For more information on ground bus isolation, refer to local electrical codes.

CAUTION

Do not isolate the ground bus from the housing unless it is specifically permitted by local electrical codes. Work inside electrical panels should only be performed by qualified electricians. Do not attempt to remove bonding conductors without approval from qualified personnel.

CAUTION

Ground conductors between supply panels must be routed through the same conduit as the supply conductors. This is a safety requirement of both the NEC and CEC.

Grounding method

CAUTION

In order to prevent ground loops, it is recommended that cabinets be powered from the same dedicated power panel, and that all cabinets are grounded to the power panel through the grounding bar.

The method of grounding used for the Option 11C depends on whether all cabinets are powered by the same service panel.

Three grounding scenarios are possible:

- 1 A single-cabinet system
- 2 A two- to five-cabinet system powered by the same service panel
- 3 A two- to five-cabinet system powered by different service panels.

Single-cabinet system or cabinets powered by one service panel

For each system cabinet, a #6 AWG (#40 Metric Wire Gauge) ground wire is connected from the cabinet to the NTBK80 ground bar provided. The ground bar, in turn, is connected to a ground source (the ground bus in the AC power service panel) and the expansion cabinets.

Cabinets powered by different service panels

For each system cabinet, a #6 AWG (#40 Metric Wire Gauge) ground wire is connected from the cabinet to the NTBK80 ground bar provided. If any cabinet cannot be powered from the same service panel, then it must be grounded separate from the others back to the service panel that supplies it.

Note: A separately grounded cabinet is grounded the same as a single-cabinet system.

Conduit requirements

Conductive conduit linking panels and equipment are legal for use as a grounding network in most countries. It is recommended that properly sized, insulated copper conductors routed inside conduit for all Option 11C system ground paths be used whenever possible. A ground link dependent on conduit may compromise or defeat the improvements made by installing dedicated panels and transformers. Here are the reasons why:

- Conduit links may be separated by personnel servicing unrelated equipment. If such a separation occurs anywhere between the Option 11C system and the building ground reference, the conduit is incapable of providing a ground path. This is a hazardous situation.
- Metallic conduit is liable to corrode over time, particularly at threaded connections. Such corrosion will increase resistance significantly. This problem is compounded when multiple links are involved. Application(s) of paint over the conduit may accelerate the corrosion process.
- Conduit is required to be anchored to secure surfaces. Often, it is bolted to structural steel members, which may function as ground conductors to very noisy equipment, such as compressors, motors, and so on. The coupling of these noisy signals into the Option 11C grounding system may seriously impair its performance. The resulting intermittent malfunctions can be difficult to trace.

Commercial power requirements

The Option 11C system is available in both AC-powered and DC-powered versions.

AC-powered version

The AC-powered version is presented in two separate sections in this Chapter:

- Optimal AC-powered installation
- Alternative AC-powered installation

The optimal installation of an AC-powered Option 11C system consists of a direct connection to the electrical system in the building, provided certain requirements are met. Refer to AC-powered installation later in this chapter for detailed information.

Alternatively, an approved isolation transformer may be used for AC-powered systems, where meeting the optimum requirements may be too expensive or may not be achievable. See “Alternative AC-powered installation” on page 46.

DC-powered version

With the DC-powered version of Option 11C, each cabinet is powered solely from a DC power source. See DC-powered version later in this chapter for detailed information.

AC-powered installation

It is recommended that a dedicated AC service panel be used with the Option 11C system. Equipment unrelated to the Option 11C must not be connected to this panel. Keep all lighting, fans, motors, air conditioning equipment, and the like, as “electrically separate” from the Option 11C system as possible.

Power from each outlet must meet the input requirements of at least one Option 11C power supply as itemized in Table 6 on page 44. Please check power requirements for other system equipment and install additional outlets if required.

Table 6
AC input requirements for each NTA04 or NTDK78 power supply

Voltage	Maximum rated input voltage 100-240 Volts RMS, single phase, 50-60 Hz.
Power (I/P max)	750 VA minimum
Outlet Type	NEMA IG5-15R for 120 Volt, 15 Amp supply NEMA IG6-15R for 208/240 Volt, 15 Amp supply

Site requirements

The following is a list of required site features for an optimal Option 11C AC-powered system installation.

If the conditions below cannot be provided with a dedicated panel, the use of an Isolation Transformer is recommended, as described under the heading “Alternative AC-powered installation” on page 46 of this chapter.

- **Dedicated circuit breaker panel**

Provides power solely to the Option 11C system and its associated hardware, such as TTYs, printers, and so on.

Note: It may not always be possible to power a complete system from a single circuit-breaker panel. For example, an expansion cabinet may be remotely located.

- **Insulated copper ground conductor**

Connects the ground bus in the dedicated panel to the main service panel ground or building ground reference. It must always be routed through the same conduit as the supply conductors feeding the panel.

- **Isolated-ground receptacles**

All outlets connected to the dedicated panel must be of the isolated ground type. A separate circuit is to be used for each device connected to the panel. Outlets serving the cabinets must be close enough so that the power cord can reach the cabinet power supply.

For systems equipped with one or two expansion cabinets, a separate outlet for each cabinet must be provided. Each outlet must be from separate circuits in the same panel.

- **Isolated ground bus in the electrical panel, where permitted by local codes.**

Location of power outlets

The maximum distance between a power outlet and the system cabinet depends on the length of the power cord. In North America, the power cord is 9 ft 10 in. (3000 mm). In countries outside North America, the power cord is 8 ft 2 in. (2490 mm).

Alternative AC-powered installation

If optimal conditions cannot be provided with a dedicated panel, the use of an Isolation Transformer with the following characteristics it is recommended:

- 120/208/240 V input, over-current protected at primary
- 120/208/240 V available at secondary outputs, each circuit breaker-protected
- Primary and secondary windings must be fully isolated from one another
- Certified for use locally as a stand alone user product (CSA, UL, or other locally recognized markings apparent)
- Capable of providing power to all Option 11C system equipment operating simultaneously at full load
- Equipment unrelated to the Option 11C system must not be powered from a transformer serving the Option 11C system.

Isolation transformer ground

It is recommended that the transformer ground have the following characteristics:

- Separate grounds for primary and secondary windings rather than common ground
- A “clean” and permanent SPG reference at the transformer secondary for the Option 11C system.

In addition, verify the ground conductors inside the transformer to ensure they are sized appropriately.

Note: Do not ground the transformer or Option 11C system to structural steel or water pipes. Connect them to a known building ground reference.

Receptacles

Receptacle requirements are as follows:

- When mounted on the wall, they must be installed within reach of the cabinet power cords
- All receptacles served by the secondary must be of the isolated ground type
- The ground prong of each outlet must be connected by an insulated conductor to the system SPG.

If the transformer has an isolated secondary ground lug, use it as the SPG. If it doesn't, use the chassis ground of the transformer as the Single Point Ground.

Installing an Isolation Transformer

Transformers with pluggable power cords:

- 1 Connect the power cords of all Option 11C system equipment to the outlets on the transformer secondary.
- 2 Secure an insulated conductor between the ground lug on the main cabinet of the Option 11C and the SPG lug on the transformer. Place a "DO NOT DISCONNECT" tag on it.

Do not fasten or tie this conductor to the power cable feeding the NTDK78 power supply.

Note: All equipment associated with the Option 11C must be powered exclusively from the secondary of the transformer, and must be grounded to the secondary isolated ground lug. Do not connect equipment unrelated to the Option 11C system to an isolation transformer powering it.

The transformer primary must be powered through a dedicated circuit. If the primary has a pluggable cord, ensure an additional ground connection is made between the Option 11C SPG and a known building ground reference. This connection is vital for safe and reliable operation. Do not connect any Option 11C system ground lines to structural steel or water pipes, or any other unreliable ground path. Use a ground point known to be "clean" and permanent. Place a "DO NOT DISCONNECT" tag on it. Figure 10 on page 48 shows the pluggable cord connections.

Figure 10
Typical pluggable cord Isolation Transformer wiring plan

Transformers without pluggable power cords

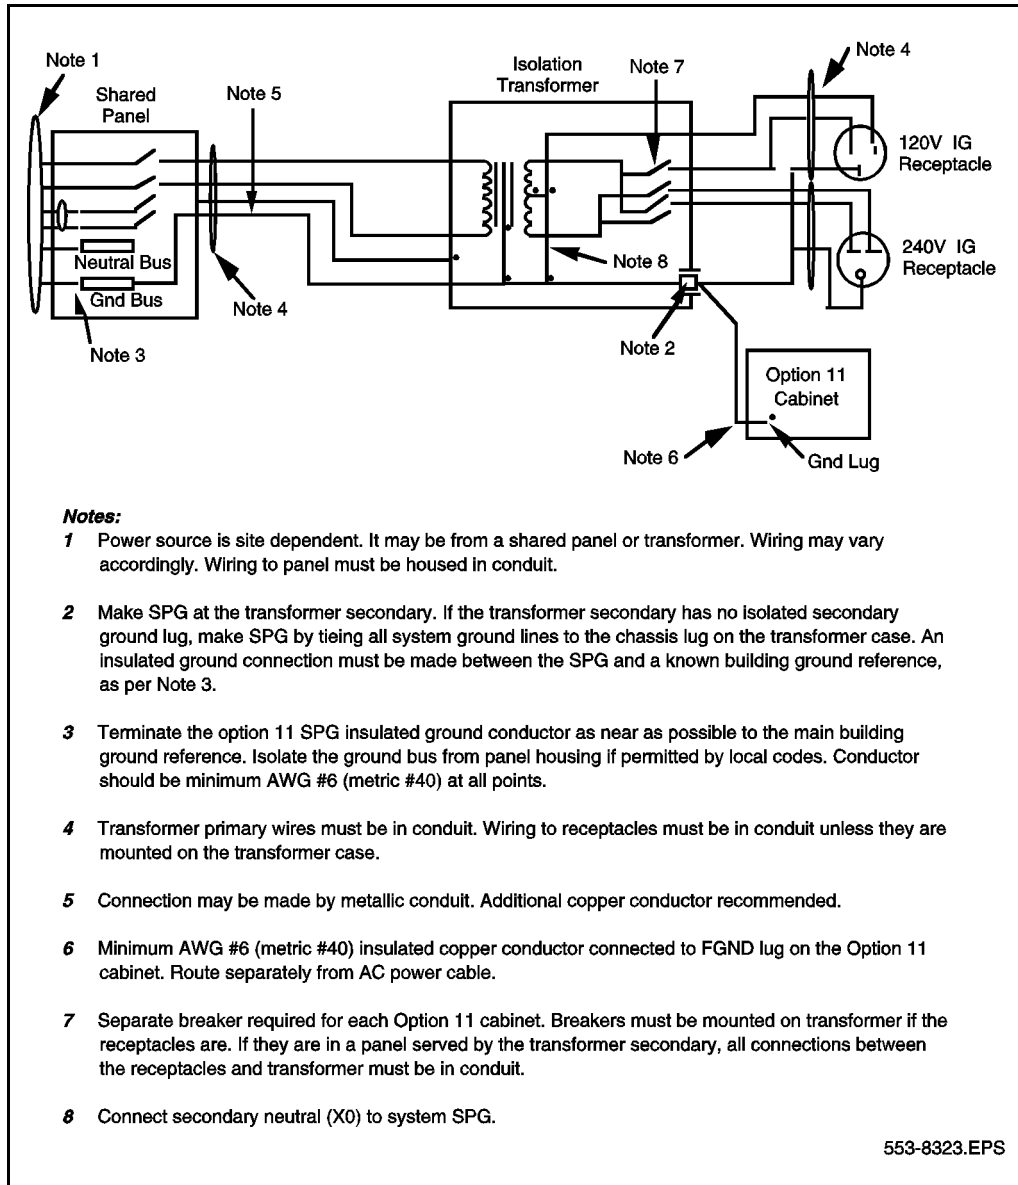

If the transformer does not have a pluggable cord, it must be hardwired to an electrical panel, and all wires (including grounds) must be routed through a single conduit.

Some electrical codes permit the use of conduit as the sole ground conductor between pieces of equipment.

It is recommended that you run a separate insulated ground conductor through the conduit to bond chassis grounds together. Such a conductor will maintain the safety ground connection in the event that the conduit becomes corroded or disconnected.

All ground lines must be run through the same conduit as the phase conductors serving the equipment. Figure 11 on page 50 shows the Isolation transformer connections.

Figure 11
Typical hardwired Isolation Transformer wiring plan

DC-powered version

Each Option 11C cabinet may be powered solely from a DC source if it is equipped with the following:

- NTDK72 DC power supply
- NTAK28 Junction box.

Table 7

DC power requirements for each NTDK72 DC power supply

	Minimum	Nominal	Maximum
Input Range	-44 V dc	-52 V dc	-54 V dc
Noise (CMESS)	—	—	25 dBrc
Current	—	—	12 Amps
AC Ripple	—	—	100 mv RMS

Note: The NTDK72 has a built-in circuit breaker that will trip if the voltage difference at its input terminals drops below -42.5 V dc +/- 1.0 V dc.

CAUTION

Do not allow the voltage difference between the input terminals of the NTDK72 to exceed 57 V dc. Doing so may result in damage to the equipment and a safety hazard to personnel.

The minimum size of the conductors required between the DC source and the Junction box is shown in Figure 8 on page 51.

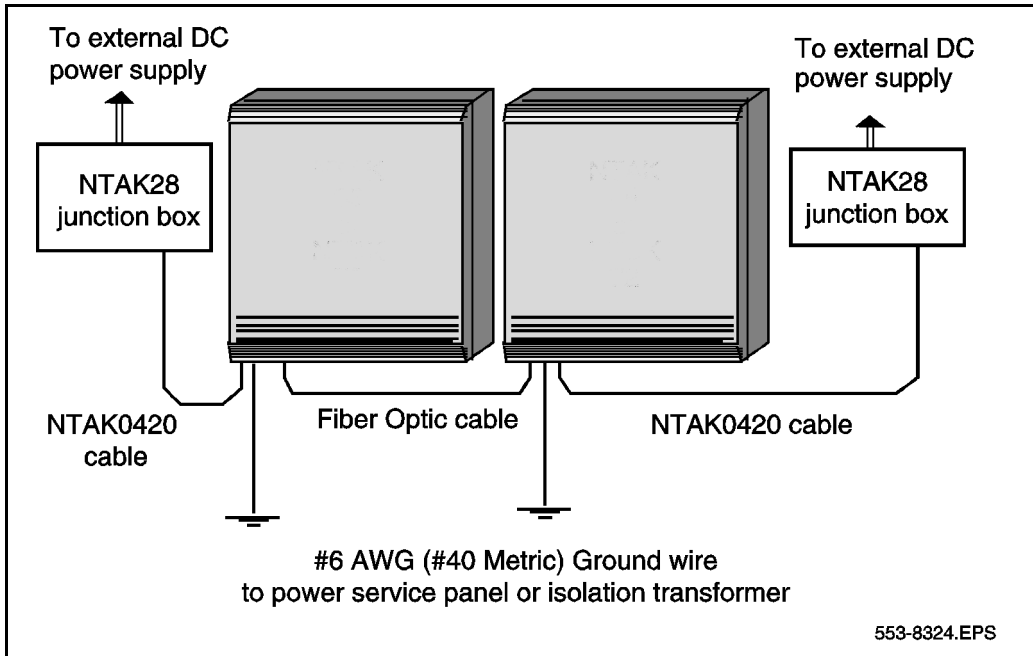

Table 8

Recommended wire size

Size (AWG)	Size (Metric)	Maximum Length (one way)
6	#40	50 ft (15 m)
8	#35	30 ft (9 m)
10	#25	20 ft (6 m)

Connect these components together as shown in Figure 12. Make sure the Option 11C main cabinet ground post is connected to the building ground reference by a minimum AWG #6 (metric #40) insulated conductor. Connect the input terminals of the NTAk28 Junction box to a clean DC power source meeting the requirements shown in Table 7 on page 51.

Figure 12
DC power supply connections

Auxiliary equipment power

Terminals, printers, modems, and other data units used in conjunction with the Option 11C require special wiring considerations.

Power for system equipment in the switch room must:

- be powered from the same panel or transformer as the Option 11C
- be grounded to the same panel or transformer as the Option 11C
- be tagged at the panel to prevent unauthorized interruption
- not be controlled by a switch between the breaker and the equipment.

Service receptacles for Option 11C AC systems and associated equipment must be:

- of the isolated ground type, such as NEMA IG5-15
- rated for 120 or 240 V, 15 or 20A, 50-60 Hz, 3-pole, 3-wire, grounded
- grounded to the same location so as to form a Single Point Ground.

Modem requirements

It is recommended that the system be equipped with a modem to allow remote access. Set-up information for modems recommended for use with the Option 11C system is found in “Modem setup requirements” on page 194.

With or without Meridian Mail

The minimum requirement is a 1200 bps auto-answer modem. The maximum modem speed is 19200 bps.

If an error-correcting modem is connected to the Meridian 1 Option 11C system, all flow-control and error-correcting functionality of the modem must be disabled to ensure proper operation. Refer to the modem manufacturer’s instructions for information.

Maintenance and administration terminals

Set-up information for Option 11C recommended terminals is found in “Terminal setup” on page 205.

A Modem Eliminator (NULL Modem without hardware handshaking) A0601397 F-F converter or A0601396 M-F converter may be required to interface the TTY to the system.

The following outlines the minimum requirements for a TTY device:

Without Meridian Mail

The minimum requirement is a VT100 compatible device when Meridian Mail is not installed, and will not be installed in the future.

With Meridian Mail

With Meridian Mail, use a VT220 compatible device.

On-site access

Each system should be equipped with an M2616 or M2008 telephone with a display assigned as a maintenance telephone.

A variety of TTY terminals can be used to access the Option 11C. However, a VT220 terminal is recommended as an on-site terminal. It can be used to perform service changes, maintenance and diagnostic functions, as well as Meridian Mail administration activities.

Remote access

Although several types of modems can be used to access the system, a 2400 baud auto-answer modem is the recommended modem and 1200 baud is the minimum. It can be used to perform service change, maintenance and diagnostic functions, as well as Meridian Mail administration activities from a remote location.

Note: Additional maintenance functions can be performed through remote access on the Option 11C. For additional information, refer to the *Customer Configuration Backup and Restore Guide*, NTP 553-3011-330.

Cross-connect terminal requirements

Allow for future expansion and equipment changes at the cross-connect terminal.

The cross-connect terminal should have sufficient space for connecting blocks to terminate the following wires:

- ten 25-pair cables from each cabinet (the main cabinet and, if equipped, each expansion cabinet)
- nine conductors comprising the AUX cable from the main cabinet
- one 25-pair cable from each QUA6 PFTU
- wiring from telephone sets and trunks.

The **BIX cross-connect system** is recommended for use with the system. However, use of this system is not mandatory. Other similar cross-connect systems can also be used.

Information about the **BIX cross-connect system** is found in “**Chapter 13 – Installing and connecting cross-connect terminals to cabinets**” on **page 147** and in the following Nortel Networks technical publications (NTPs):

- *BIX In-Building Cross-Connect System Material Description* (NTP 631-4511-100)
- *BIX In-Building Cross-Connect System Planning* (NTP 631-4511-150)
- *BIX In-Building Cross-Connect System Material Installation and Servicing* (NTP 631-4511-200)

Equipment layout plan

Before installing the Option 11C, you need to develop an equipment layout plan to determine where each system component will be positioned.

Note: Examples shown in this chapter refer to three cabinet systems.

Consideration should be given to the lengths of the various cables in order to make the best use of space available. Refer to “Cables and wires” on page 32 of this guide for a complete description of Option 11C cable and wire specifications.

Preparation of the site according to the plan is critical. Site preparation consists of making sure the site is ready to accept the equipment and that items such as power outlets and backboards are correctly installed.

General layout guidelines

CAUTION

The mounting surface must be able to support at least 100 lb (45 kg). It is recommended that you secure a backboard consisting of 3/4 in. (20 mm) plywood, or other similar material, to the surface of the wall to hold the equipment.

Follow the guidelines below to assist you in positioning the system equipment. If you plan on installing one or more expansion cabinets, you should read the section called “Additional considerations for multiple-cabinet systems” on page 58.

- The recommended method of system cabinet installation is wall-mounting. If you cannot mount the cabinets on the wall (for example, if there is not enough wall space), you can mount each cabinet on an optional pedestal. However, you will still need wall space for installing a cross-connect terminal and other optional equipment.
- Each Option 11C cabinet measures 25 in. (635 mm) high by 22 in. (560 mm) wide by 12 in. (305 mm) deep, or 14 in. (356 mm) deep with the newer Option 11C door.

- Leave adequate space for one or more expansion cabinets. When possible, the expansion cabinets should be mounted next to each other horizontally (horizontal expansion) to ensure proper heat dissipation.
- If horizontal expansion is not possible, vertical expansion is permitted for two cabinets. Make sure the expansion cabinet is mounted above the main cabinet.

Vertical expansion of three or more cabinets is not recommended. Such a configuration makes reaching the top-most cabinet difficult.

Note: Temperature limits are more stringent when expanding vertically. Review the temperature limits stated in the *Environmental requirements* section of this guide before deciding to expand vertically. Do not install an expansion cabinet on top of an existing floor-mounted cabinet.

- When planning for a system that is equipped with DTI/PRI capability, allow space on the backboard for the channel service unit (CSU).
- Leave at least 6 in. (155 mm) above the mounting bracket and any obstruction (such as a pipe or conduit) so that there is room to lift the cabinet on and off the bracket.
- Leave at least 12 in. (305 mm) between the top of a cabinet and the ceiling to ensure proper ventilation.
- Leave 10 in. (255 mm) between the bottom of the lower cabinet and the floor to prevent water damage and to allow for convectional cooling.
- Do not place the cross-connect terminal above a cabinet. Debris from the cross-connect terminal may drop into the cabinet through the top ventilation slots and cause damage.
- Allow adequate space for the battery backup unit, accounting for the cable-length limitation as determined by the choice of a wall-mounted or floor-mounted battery back-up unit.
- If the NTAK92 Off-premises protection module is used, allow for proper installation (according to local practices)
- Ensure power outlets are within reach of each system cabinet. Cable and wire specifications are shown in Table 2, “ Cable and wire specifications,” on page 32.

Additional considerations for multiple-cabinet systems

For multi-cabinet systems the following guidelines apply for both horizontal and vertical expansion:

- The maximum distance between the main cabinet and each expansion cabinet is 1.8 mi (3 km).
- The minimum distance between cabinets when mounted above one another (vertical expansion) should be 12 in. (305 mm).
- The minimum distance between cabinets when mounted next to each other (horizontal expansion) is defined by an alignment bracket as shown in Figure 15 on page 61. However, this is the minimum distance; the cabinets can be positioned further apart to suit site requirements.

Note 1: The equipment layout plans shown in this chapter are applicable to fiber-optic connected cabinets installed within close proximity to each other (such as on the same wall). These layout guidelines are not as stringent if the cabinets are located in separate rooms, on different floors, or in different buildings.

Note 2: The examples given in the following pages for multi cabinet systems, apply to three cabinets (1 Main, 2 Expansion) systems only. However, up to four expansion cabinets or Mini chassis can be connected to a Main Option 11C cabinet for a maximum configuration of five cabinets.

Systems using NTAK75 or NTAK76 reserve power

The mounting location of either the NTAK75 or the NTAK76 backup-up unit is governed by the location of the Option 11C cabinets and the length of the NTAK0410 cable. The NTAK0410 cable is 6 ft (1830 mm) long.

Equipment layout plan for wall mounting

Typical wall layouts using BIX cross-connection equipment are shown in Figure 14 on page 60 and Figure 16 on page 63. Use of other types of terminal blocks and equipment will alter the layout. As a result, you may need to adjust the height at which you place the cabinets in relation to other equipment. You may also need to adjust the distances the power outlets are from the backboard on AC powered systems. The positions for the mounting brackets are shown in Figure 15 on page 61.

Figure 13
Typical minimum distance layout of wall mounted cabinets (horizontal expansion)

Figure 14
Typical minimum distance layout of wall-mounted cabinets (vertical expansion)

Figure 15
Mounting bracket position

The equipment layout plan for floor mounting

An optional cabinet pedestal is used for floor-mounting when it is not possible to mount the cabinets on a wall.

The available floor space must be large enough to accommodate the main cabinet and one, or more expansion cabinets, as shown in Figure 16 on page 63.

Note: Although you may be installing only a main cabinet at this time, leave enough space for expansion cabinets to avoid problems in the future.

Wall space must be available for the cross connect terminal, the cross-connect cables, the NTAK76 battery unit if required, and any miscellaneous equipment (such as a power supply for digit displays on telephones).

CAUTION

Make sure that cabinet placement does not allow debris from sources such as cross-connect terminal activities to fall into the ventilation slots located at the top of the cabinet.

Leave at least 12 in. (305 mm) of space between the top of the cabinet and any obstruction (such as a shelf) to permit adequate air circulation.

Figure 16
Typical layout of floor mounted cabinets

Reserve power supply layout and installation planning

The mounting location of either the NTAK75 or the NTAK76 reserve power unit is governed by the location of the main and expansion cabinets, and the length of the NTAK0410 cable (the NTAK0410 cable is 6 ft [1830 mm] long). Below each of the figures on the following pages, you will find information detailing the maximum distance the center line of the battery unit may be placed from the cabinet center line.

Figure 17
Typical placement of NTAK76 (horizontal cabinet expansion)

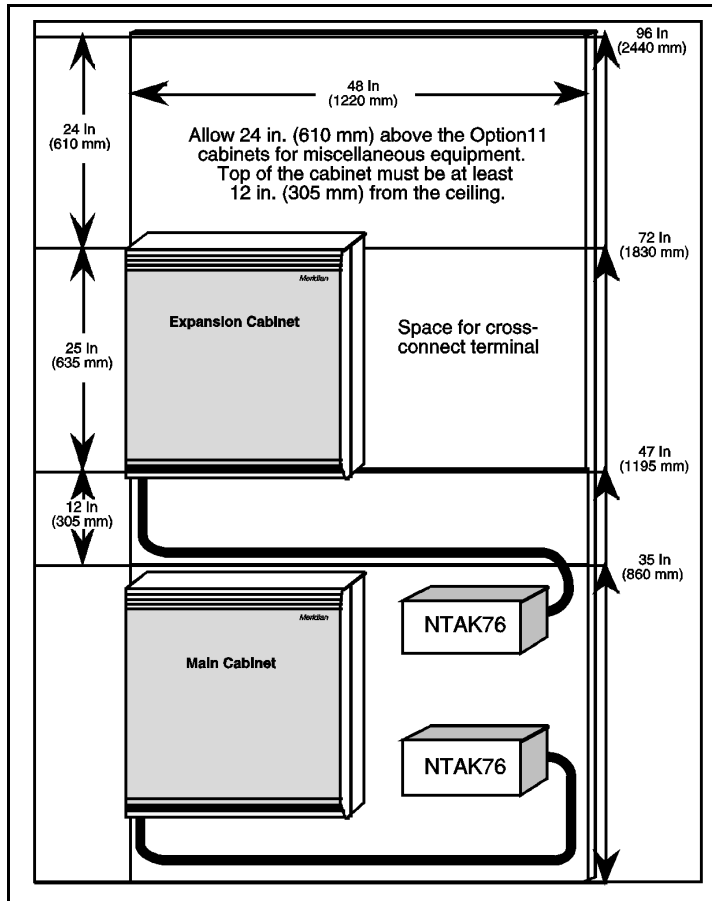

The center line of the NTAK76 may be placed a maximum of 2 ft (610 mm) to the right and 4 ft (1220 mm) to the left of the cabinet center line. These distances are based on the top of the NTAK76 being positioned 1.5 ft (460 mm) below the bottom of the cabinet.

Figure 18
Typical placement of NTA75 (horizontal cabinet expansion)

The center line of the NTA75 may be placed a maximum of 0.5 ft (152 mm) to the right and 2.5 ft (760 mm) to the left of the cabinet center line. These distances are based on the cabinets being mounted at the recommended mounting heights, shown in the diagram above, for the horizontal mounting configuration.

Figure 19
Typical placement of NTAK76 (Vertical cabinet expansion)

The center line of the NTAK76 may be placed a maximum of 2 ft (610 mm) to the right and 4 ft (1220 mm) to the left of the cabinet center line. These distances are based on the top the upper NTAK76 being positioned 1.5 ft (460 mm) below the bottom of the Expansion Cabinet, and the bottom of lower NTAK76 being positioned 1.5 ft (460 mm) below the bottom of the Main Cabinet.

Figure 20
Typical placement of NTA76 (Three-cabinet system)

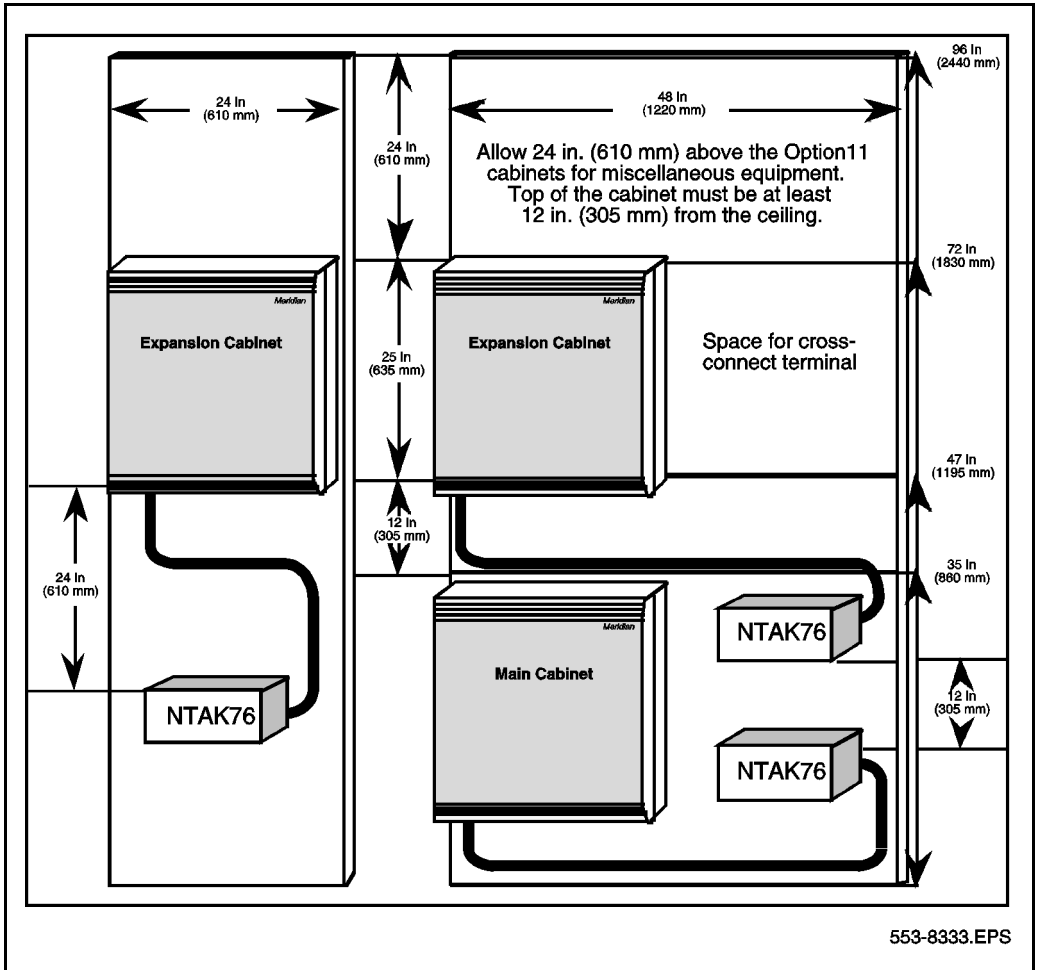

Figure 21
Typical placement of NTA75 (Vertical cabinet expansion)

The center line of the NTA75 for the Expansion Cabinet may be placed a maximum of 2.5 ft (760 mm) to the left of the center line of the cabinet. The center line of the NTA75 for the Main Cabinet may be placed a maximum of 2 ft (610 mm) to the right of the center line of the cabinet. These distances are based on the cabinets being mounted at the recommended heights, as shown in the diagram above, for the vertical mounting configuration.

Figure 22
Typical placement of NTAk75 (Three-cabinet system)

Card slot assignments

A card slot allocation plan showing circuit card to slot assignments should be prepared in advance for each cabinet. See the most current Option 11C product bulletins for minimum vintage requirements.

The NTDK20 Small System Controller (SSC) card must be installed in the main cabinet in the SSC slot (slot 0). It supports the following optional daughterboards:

- the NTDK22 10 m Single Port Fiber Expansion Daughterboard
- the NTDK24 3 km Single Port Fiber Expansion Daughterboard (Multimode)
- the NTDK79 3 km Single Port Fiber Expansion Daughterboard (Single Mode)
- the NTDK84 10 m Dual Port Fiber Expansion Daughterboard
- the NTDK85 3 km Dual Port Fiber Expansion Daughterboard (Multimode)

Note: Dual Port Fiber Expansion Daughterboards require NTDK20CA or later versions of SSC card.

- the NTDK26 Upgrade Daughterboard.

The following cards **MUST** be installed in the main cabinet slots 1-9:

- the NTAK09, 1.5 Mb DTI/PRI
- the NTDK10, 2.0 Mb DTI
- the NTBK22, MISP
- the NT6D70 when used as a clock controller.
- the NTAK79, 2.0 Mb PRI
- the NTBK50, 2.0 Mb PRI
- the NTRB21

The NTAK09 supports two optional daughterboards, the NTAK20 clock controller and the NTAK93 D-channel interface. The NTB50 will support the NTAK20 and either the NTB51 DDCH daughterboard or the NTAK93 D channel interface.

The NTRB21 supports one optional daughterboard, the NTAK20 clock controller, and incorporates the functionality of the NTB50 or NTSK93 daughterboards.

To prepare the plan, list the total number of the following circuit cards required for the installation:

Used only in the main cabinet

NTDK20 SSC	____1____
NTAK02 SDI/DCH	_____
NTAK03 TDS/DTR	_____
NTAK09 1.5 Mb DTI/PRI	_____
NTRB21	_____
NTBK22 MISP	_____
NT6D70 SILC	_____ (if clock controller is active)
Meridian Mail	_____

Used only in expansion cabinets

NTDK23 10 m Fiber receiver	_____
NTDK25 or NTDK80 3 km Fiber receiver	_____

Used in the main and expansion cabinets

NT8D02 Digital line card	_____
NT8D09 Message waiting	_____
NT8D14 Universal Trunk	_____
NT8D16 Digitone Receiver	_____

NT8D15 E&M Trunk	_____
NT7D16 Data Access	_____
NT6D70 SILC (see Note 1)	_____
NT6D71 UILC	_____
NT5K02 XFALC	_____
NT5K18 XFCOT	_____
NT5K17 XDDI	_____
NT5K19 XFEM	_____
NT5K36 XDID/DOD	_____
NT5K21 XMFC/MFE	_____
NT5K21, NTAG26 XMFC/MFE	_____
Other country specific cards	_____

Note 1: The NT6D70 SILC card must be installed in the main cabinet (slots 1 through 9) if it is used as a clock controller.

Note 2: Each fiber expansion cabinet must have either an NTDK23, NTDK25 or NTDK80 Fiber-receiver card positioned in slot 0.

If NE-A25B cables are used instead of NTAK19AA and NTAK19BA cables with the NTAK02 and NTAK03 cards, proceed with care. NE-A25B cables are not wired out to station equipment or trunk circuits. They may only be wired out to SDI circuits.

Be sure to allocate the cards to the main cabinet which must reside there first. Fill in the remaining card slots as required.

If you plan on using the pre-assigned numbering plan with consecutive numbers, it is important to assign all line cards in consecutive card slots.

Chapter 4 — Regulatory information

General information

This chapter includes regulatory information for American, Canadian and International installations pertinent to the Option 11C system installation.

WARNING

The fiber optic interface product used in Option 11C is considered safe. However, as a precaution do not view the optical port or the end of fiber optic cable.

Under certain conditions (such as during cable testing or under light magnification) the cable or port may expose the eye beyond the limits of Maximum Permissible Exposure recommended in some jurisdictions. Do not remove protective caps or plugs until ready to connect the cable.

Notice for United States installations

The Meridian 1 Option 11C system complies with Part 68 of the FCC rules. On the lower left corner of each system cabinet is a label that contains, among other information, the FCC registration number and Ringer Equivalence Number (REN) for this equipment. If requested, this information must be provided to the telephone company.

Meridian 1 Option 11C regulatory labels include:

- FCC registration: AB6982-14234-MF-E
- FCC registration: AB6982-62937-PF-E
- FCC registration: AB6CAN-61117-MF-E

- FCC registration: AB6CAN-61116-PF-E
- FCC registration: AB6USA-18923-KF-E
- FCC registration: AB6CAN-18924-KF-E
- Service code: 9.0F, 6.0P.

Importance of Ringer Equivalence Number

The FCC regulation label includes the Ringer Equivalence Number (REN). This number is a representation of the electrical load that will be applied to your telephone line once the PBX is plugged into the wall jack. The telephone line serving your premises will not operate properly if the total ringer load exceeds the capability of the telephone company central office equipment. That is, if too many ringers are connected to the line, there may be insufficient energy to ring your system. If the ringer load is excessive, you may also have difficulty dialing telephone numbers.

For more information about the total REN permitted for your telephone line, contact your local telephone company. However, as a guideline, a total REN of five should allow normal operation of your equipment.

If your Meridian 1 Option 11C equipment causes harm to the telephone network, the telephone company may discontinue your service temporarily. The telephone company may ask you to disconnect the equipment from the network until the problem has been corrected, or you are sure that the equipment is not malfunctioning. If it is possible, they will notify you in advance of the pending disconnection. You will also be advised of your right to file a complaint with the FCC.

Your telephone company may make changes in its facilities, equipment, operations or procedures that could affect the proper operation of your equipment. If they do, you will be given advance notice so as to give you an opportunity to maintain uninterrupted service.

If you experience trouble with your Meridian 1 Option 11C equipment, contact your authorized distributor or service center in the USA for repair or warranty information. If you do not know how to contact your distributor, call 1-800-328-8800.

Hearing aid compatibility

All proprietary telephones used with the Meridian 1 Option 11C comply with the requirements of FCC Part 68 Rule 68.316 for hearing aid compatibility.

Notice for Canadian installations

The Industry Canada - formerly called the Canadian Department of Communications - label identifies certified equipment. This certification means that the equipment meets certain telecommunications network protective, operational and safety requirements. The Department does not guarantee that the equipment will operate to the user's satisfaction.

The Load Number (LN) assigned to each terminal device is the percentage of the total load that can be connected to a telephone loop using the device. This number prevents overloading. The termination on a loop can consist of any combination of devices, provided that the total of the Load Numbers does not exceed 100. An alphabetic suffix is also specified in the Load Number for the appropriate ringing type (A or B), if applicable. For example, LN = 20 A designates a Load Number of 20 and an "A" type ringer.

Before installing any equipment, users should ensure it is permissible to be connected to the facilities of the local telecommunications company. The equipment must be installed using an acceptable method of connection. In some cases, the company's inside wiring associated with a single line individual service may be extended by means of a certified connector assembly (telephone extension cord). The customer should be aware that compliance with the above conditions may not prevent degradation of service in some situations.

Repairs to certified equipment should be made by an authorized Canadian maintenance facility designated by the supplier. Any repairs or alterations made by the user to this equipment, or equipment malfunctions, may give the telephone company cause to request the user to disconnect the equipment.

Users should ensure for their own protection that the electrical ground connections of the power utility, telephone lines and internal metallic water pipe system, if present, are connected together. This precaution may be particularly important in rural areas.

CAUTION

The Option 11C frame ground of each system cabinet must be tied to a reliable building ground reference.

WARNING

Users should not attempt to make electrical ground connections themselves, but should contact their local electrical inspection authority or electrician.

Notice for International installations

If there is insufficient planning or technical information present for your country of operation, contact your regional telecommunications distributor or authority for assistance.

European compliance information

The Option 11C system meets the following European technical regulations: CTR 1, CTR 2, CTR 3, CTR 4, CTR 6, CTR 10, CTR 12, CTR 13, CTR 15, CTR 17, CTR 22, CTR 24, and the I-ETS 300 131.

Supported interfaces

Analog interfaces are approved based on national or European specifications. Digital interfaces are approved based on European specifications.

Safety specifications

The Option 11C system meets the following European safety specifications: EN 60825, EN 60950, EN 41003

Electromagnetic Compatibility

Table 9 shows the Electromagnetic Compatibility (EMC) specifications for the Option 11C system.

Table 9
Option 11C System EMC specifications

Emission:	EN 55022 EN 50082-1 EN 300329 ETS 300446	
Immunity:	EN 61000-4-2	Electrostatic discharge
	EN 61000-4-3	Electromagnetic field
	EN 61000 4-4	Fast transient burst

Canadian and U.S.A. Network connections

Table 10 on page 81 contains information that must be given to the local telephone company when ordering standard network interface jacks for the Option 11C system.

Note: Table 10 includes columns for system port identification, Facility Interface Code (FIC), Service Order Code (SOC), USOC jack identification and associated Nortel equipment part numbers.

FCC compliance: registered equipment for Direct Inward Dial (DID) calls

Equipment registered for Direct Inward Dial (DID) calls must provide proper answer supervision. Failure to meet this requirement is a violation of part 68 of the FCC's rules.

Proper answer supervision is defined as follows:

- DID equipment returns answer supervision to the Central Office when DID calls are:
 - answered by the called station
 - answered by the attendant
 - routed to a recorded announcement that can be administered by the CPE user
 - routed to a dial prompt.

- DID equipment returns answer supervision on all DID calls forwarded to the Central Office. Permissible exceptions are if:
 - a call is unanswered
 - a busy tone is received
 - a reorder tone is received.

Table 10

Radio and TV interference

Information for the United States

Option 11C complies with Part 15 of the FCC rules in the U.S.A. Operation is subject to the following two conditions:

- Option 11C may not cause harmful interference.
- Option 11C must accept any interference received, including interference that may cause undesired operation.

If the Meridian 1 Option 11C causes interference to radio or television reception, which can be determined by placing a telephone call while monitoring, the user is encouraged to try to correct the interference by the following measures:

- Reorient the receiving TV or radio antenna where this may be done safely.
- To the extent possible, relocate the receiver with respect to the telephone equipment.

If necessary, the user should consult the dealer or an experienced radio or television technician for additional suggestions. The user may also find helpful the booklet “How to Identify and Resolve Radio-TV Interference,” prepared by the Federal Communications Commission. This booklet is available from the U.S. Government Printing Office, Washington, DC 20402.

Information for Canada

The Option 11C system does not exceed Class A limits for radio noise emissions from digital apparatus, as set out in the radio interference regulations of Industry Canada.

Chapter 5 — Important safety instructions

General information

SAVE THESE INSTRUCTIONS

This Chapter provides important safety information for installing and using your telephone equipment. Make sure this Chapter is readily available for use as a reference tool.

Symbols you should recognize

Whenever you see the symbol shown below on Option 11C equipment or documentation, it is intended to alert the you to the presence of important operating and maintenance instructions.

Safety instructions when installing telephone equipment

- 1 Never install telephone wiring during a lightning storm.
- 2 Never install telephone jacks in wet locations unless the jack is specifically designed for wet locations.
- 3 Never touch uninsulated telephone wires or terminals unless the telephone line has been disconnected at the network interface.
- 4 Use caution when installing or modifying telephone lines.

Safety instructions when using telephone equipment

When using telephone equipment, basic safety precautions should always be followed to reduce the risk of fire, electric shock, and injury to persons, including the following:

- 1 Follow all warnings and instructions marked on the product.
- 2 Unplug the telephone from the wall outlet before cleaning. Do not use liquid cleaners or aerosol cleaners. Use a damp cloth for cleaning.
- 3 Do not use the telephone near water, for example, near a bath tub, wash bowl, kitchen sink, or laundry tub, in a wet basement or near a swimming pool.
- 4 Do not place the telephone on an unstable cart, stand, or table. The product may fall, causing serious damage to the product.
- 5 Slots and openings in the cabinet and the back or bottom are provided for ventilation, to protect it from overheating. These openings should never be blocked or covered.
- 6 The openings on a telephone should never be blocked by placing the product on the bed, sofa, rug, or other similar surface. The product should never be placed near or over a radiator or heat register. The product should not be placed in a built-in installation unless proper ventilation is provided.

- 7** The product should be operated only from the type of power source indicated on the marking label. If you are not sure of the type of power supply, consult your distributor.
- 8** Some equipment is equipped with a three-wire grounding type plug: a plug having a third grounding pin. The plug will only fit into a grounding type power outlet. This is a safety feature. If you are unable to insert the plug into the outlet, contact your electrician to replace the obsolete outlet. Do not defeat the purposes of the grounding-type plug.

Some equipment is equipped with a polarized line plug: a plug having one blade wider than the other. This plug will fit into the power outlet only one way. This also is a safety feature. If you are unable to insert the plug fully into the outlet, try reversing the plug. If the plug still doesn't fit, contact your electrician to replace the obsolete plug. Do not defeat the purpose of the polarized plug.

- 9** Do not allow anything to rest on the power cord. Do not locate the product where the cord will be abused by persons walking on it.
- 10** Do not overload wall outlets and extension cords as this can result in the risk of fire or electrical shock.
- 11** Never push objects of any kind into the product through cabinet slots as they may touch dangerous voltage points, or short out parts that could result in a risk of fire or electrical shock. Never spill liquid of any kind onto the product.
- 12** To reduce the risk of electrical shock, do not disassemble a non-operating product.
- 13** Unplug the telephone from the wall outlet and refer servicing to qualified personnel under the following conditions:
 - a** When the power supply cord or plug is damaged or frayed
 - b** If liquid has been spilled into the telephone
 - c** If the telephone has been exposed to rain or water
 - d** If the telephone has been dropped or the cabinet has been damaged
 - e** If the product exhibits a distinct change in performance
 - f** If the telephone does not function properly under normal operating conditions

- 14 Avoid using a telephone (other than a cordless type) during an electrical storm. There may be a remote risk of electric shock from lightning.
- 15 Do not use the telephone to report a gas leak in the vicinity of the leak.

Fiber optic cable handling precautions

WARNING

The fiber optic interface product used in Option 11C is considered safe. However, as a precaution do not view the optical port or the end of fiber optic cable. Under certain conditions (such as during cable testing or under light magnification) the cable or port may expose the eye beyond the limits of Maximum Permissible Exposure recommended in some jurisdictions. Do not remove protective caps or plugs until ready to connect the cable.

The following safety precautions must be followed when handling fiber equipment:

- All persons handling Fiber Expansion daughterboards and Receiver cards must be Electrostatic Discharge (ESD) protected. A wrist strap provided with the cabinet also must be worn when handling fiber optic cables to prevent damage caused by static electricity.
- Always ensure the fiber optic cable is routed out of the way of any traffic through the premises.
- Never staple or bend the fiber optic cable at an extreme angle. Do not exceed the minimum bend radius of 1.5 in. (35 mm) (90° soft bend).

Note: A conduit is not required for routing fiber optic cable between cabinets. However, if you require a conduit for identification or other reasons, use a conduit measuring a minimum of 1 in. (25 mm) in diameter.

Chapter 6 – Bracing cabinets against earthquakes

General information

This chapter provides important information for bracing the Option 11C system cabinets against earthquakes. Cabinets must be mounted on the wall in order to meet earthquake protection requirements.

Method for earthquake bracing

Earthquake bracing is performed by securely fastening a 3/4 in.(20 mm) sheet of plywood to the wall, then placing the system components on the backboard (not attaching them directly to the wall).

Procedure 1

Method for earthquake bracing Option 11C system cabinets

1 Determine the size of the backboard.

You will need a backboard that is large enough to accommodate all of your wall-mounted components. To determine the size of your backboard, refer to the wall plan that you developed according to the guidelines given in “Earthquake bracing requirements” on page 38. If you have not developed a wall plan, please do so immediately.

When you have determined the required backboard size, make sure it is within the following limits:

Table 11
Backboard size limits

	Backboard size
Minimum	2 ft by 6 ft (600 mm by 1800 mm)
Maximum	4 ft by 8 ft (1200 mm by 2400 mm)

2 Determine fastener requirements

To determine fastener requirements, you will need the following information:

- What fasteners to use.
- The minimum embedment of the fasteners into the wall.
- The vertical distance between fasteners.
- The horizontal distance between fasteners.
- For wood and metal stud walls, this requirement is determined by the spacing between wall studs, which must be within the following range:

Table 12
Stud spacing

	Stud spacing
Minimum	16 in. (400 mm)
Maximum	24 in. (600 mm)

- The required wall stud sizes for wood and metal stud walls.

Table 13
Hardware recommendations

Type of wall	Fastener	Vertical spacing between fasteners	Minimum embedment
Wood stud	#10 Wood Screws	12 in. (300 mm) on center	1 in. (25 mm)
Metal stud	#14 Sheet Metal Screws	12 in. (300 mm) on center	
Concrete	1/4 in. (6 mm) Hilti KB-II	24 in. (600 mm) on center	1 1/8 in. (28 mm)
Masonry	1/4 in. (6 mm) Ramset Redhead Dynabolt Sleeve Anchor	24 in. (600 mm) on center	

Table 14
Minimum wall stud sizes — 16 inch spacing

Wall Studs	Maximum Height of wall
Wood Studs	
2 X 4 (DF #2)	11 ft (3300 mm)
2 X 6 (DF #2)	19 ft (5700 mm)
Metal Studs	
2 1/2 X 20 Gauge	9 ft (2700 mm)
2 1/2 X 16 Gauge	10 ft (3000 mm)
2 1/2 X 14 Gauge	11 ft (3300 mm)
3 5/8 X 20 Gauge	12 ft (3600 mm)
3 5/8 X 18 Gauge	13 ft (3900 mm)
3 5/8 X 16 Gauge	14 ft (4200 mm)
3 5/8 X 14 Gauge	16 ft (4800 mm)
4 X 20 Gauge	14 ft (4200 mm)
4 X 18 Gauge	15 ft (4500 mm)
4 X 16 Gauge	16 ft (4800 mm)
4 X 14 Gauge	17 ft (5100 mm)
6 X 18 Gauge	20 ft (6000 mm)

Table 15
Minimum wall stud sizes - 24 inch spacing

Wall Studs	Maximum Height of wall
Wood Studs	
2 X 4 (DF #2)	10 ft (3000 mm)
2 X 6 (DF #2)	17 ft (5100 mm)
Metal Studs	
2 1/2 X 20 Gauge	8 ft (2400 mm)
2 1/2 X 18 Gauge	9 ft (2700 mm)
2 1/2 X 14 Gauge	10 ft (3000 mm)
3 5/8 X 20 Gauge	11 ft (3300 mm)
3 5/8 X 18 Gauge	12 ft (3600 mm)
3 5/8 X 16 Gauge	13 ft (3900 mm)
3 5/8 X 14 Gauge	15 ft (4500 mm)
4 X 20 Gauge	12 ft (3600 mm)
4 X 18 Gauge	13 ft (3900 mm)
4 X 16 Gauge	14 ft (4200 mm)
4 X 14 Gauge	16 ft (4800 mm)
6 X 18 Gauge	18 ft (5400 mm)

3 Determine the placement of fasteners

Refer to the figures on the following pages if you need assistance with the placement of fasteners on the backboard. In each figure, the minimum sized backboard (2 ft by 6 ft) and the maximum sized backboard (4 ft by 8 ft) are used as examples:

- **Figure 25 on page 91:** provides fastener locations for wood and metal stud walls with the minimum allowed stud spacing of 16 in. (400 mm).
- **Figure 26 on page 92:** provides fastener locations for wood and metal stud walls with the maximum allowed stud spacing of 24 in. (600 mm).
- **Figure 27 on page 93:** provides fastener locations for concrete and masonry walls.

Figure 25**Plywood fastener locations for wood and metal stud walls — 16 inch spacing**

Figure 26
Plywood fastener locations for wood and metal stud walls — 24 inch spacing

Figure 27
Plywood fastener locations for concrete and masonry walls

4 Proceed with Option 11C system installation

Now that you have securely fastened the backboard to the wall, you can proceed with the Option 11C system Installation.

----- *End of Procedure* -----

Chapter 7 – Preparing for installation

General information

Before proceeding with the installation, make sure you have all the tools necessary to install the Option 11C. Next, make sure you have checked for all site requirements, received all equipment, and that you have prepared an equipment layout plan and card slot assignment plan.

Tools checklist

To properly install the system, make sure that the following tools are available before starting to assemble the components:

- a variety of screwdrivers
- a tape measure
- a level
- pliers such as side cutters and longnose pliers
- an ECOS 1023 POW-R-MATE or similar type test meter
- appropriate cable terminating tools
- a drill for drilling lead holes for screws

Readiness checklist

Have you:

- read all *safety instructions* in the first part of this guide?
- checked to ensure you received all the equipment that was ordered?
- made sure your area meets all environmental requirements?
- checked for all power requirements?
- checked for proper grounding facilities?
- developed an equipment layout plan for the system?
- completed the card slot allocation plan?
- assembled all the tools required to proceed with the installation?

If you have completed all of the above items, you are ready to proceed with the installation of the system.

Chapter 8 – Installation Procedures

General information

This chapter is used when installing a new Option 11C system, adding expansion cabinets to an existing system, or reconfiguring existing cabinets to accommodate an additional expansion cabinet. Make sure you have read and completed all instructions contained in the prior chapters of this guide.

Installing the system

Follow the steps in Procedure 2 to install a new Option 11C system. Complete each step as described before proceeding with the next step. Follow the steps in Procedure 3 to add expansion cabinets to an existing system. Implement Procedure 4 if you need to reconfigure your existing system. References may be made to other chapters in this guide in order to provide additional information.

CAUTION

Wear the antistatic wrist strap provided in the bottom of the cabinet before handling the power supplies or other circuit cards. Static electricity can damage the components of power supplies and circuit cards.

Procedure 2
New system installation

1 Install the Main Cabinet

- a) Mount the cabinets as described in “Chapter 9 – Mounting the cabinets” on page 103.
- b) Remove the drip tray from each cabinet to expose the cable routing grooves at the bottom rear of the cabinet.
- c) Install the cabinet ground wire for the main cabinet as described in “Chapter 10 – Installing the system ground” on page 113.
- d) Install the power supply as described in “Chapter 11– Installing the power supplies” on page 119.
- e) Install the reserve power supply if required.
Refer to “Chapter 16 – Installing and connecting reserve power supplies” on page 179.
- f) Install a Cable Routing Guide if this is a multi-cabinet system.
Refer to “Chapter 8 – Installation Procedures” on page 97.
- g) Install the System Controller Card, daughterboards and related components. Refer to “Chapter 12 – Installing the System Controller Card and Components” on page 131”.
- h) Install the remaining circuit cards. Refer to “Chapter 15 – Installing the circuit cards” on page 165.
- i) Install the cross-connect terminal and Cables. Refer to “Chapter 13 – Installing and connecting cross-connect terminals to cabinets” on page 147.
- j) Install the power fail transfer units (PFTUs) if provided. Refer to “Chapter 14 – Installing power fail transfer units” on page 159.
- k) Connect the SDI and ethernet interfaces Refer to “Chapter 17 – Installing and connecting SDI and ethernet ports” on page 193

2 Install Expansion Cabinets

- a) Mount the cabinets as described in “Chapter 9 – Mounting the cabinets” on page 103.
- b) Remove the drip tray from each cabinet to expose the cable routing grooves at the bottom rear of the cabinet.
- c) Install the cabinet ground wire as described in “**Chapter 10 – Installing the system ground**” on page 113.
- d) Install the power supply as described in “**Chapter 11– Installing the power supplies**” on page 119.
- e) Install the reserve power supply if required.
Refer to “**Chapter 16 – Installing and connecting reserve power supplies**” on page 179.
- f) Install the Fiber Receiver card. Refer to “Chapter 12 – Installing the System Controller Card and Components” on page 131
- g) Install a Cable Routing Guide in each expansion cabinet, as shown in Figure 46 of “Chapter 12 – Installing the System Controller Card and Components” on page 131.
- h) Install the remaining circuit cards. Refer to “**Chapter 15 – Installing the circuit cards**” on page 165.
- i) Install the cross-connect terminal and Cables. Refer to “**Chapter 13 – Installing and connecting cross-connect terminals to cabinets**” on page 147.
- j) Install the power fail transfer units (PFTUs) if provided. Refer to “**Chapter 14 – Installing power fail transfer units**” on page 159.
- k) Connect the SDI and ethernet interfaces Refer to “**Chapter 17 – Installing and connecting SDI and ethernet ports**” on page 193

3 Connect the main and expansion cabinets together in a point-to-point configuration.

Connect each fiber optic cable to the connector on the Fiber expansion daughterboard as shown in Figure 46 of “Chapter 12 – Installing the System Controller Card and Components” on page 131.

- 4 **Power up the main and expansion cabinets.**
- 5 **Check the “link” led on the daughterboard. If the led is not lit and green, the hardware connection is not enabled. Check the cables and connections.**
- 6 **Install the System Software. Refer to “Chapter 18 – System start up and software installation” on page 213**
- 7 **Install (if not previously installed) and activate the telephones. Refer to “Chapter 19 – Connecting the telephones” on page 231.**
- 8 **Connect the trunks to the system as described in “Chapter 20 – Connecting the trunks” on page 259**
- 9 **Perform a system backup, using overlay 43.**
- 10 **Install any remaining equipment, such as external alarms (Refer to “Chapter 21 – Connecting an external alarm” on page 285) and the optional Meridian Mail feature, if provided.**
- 11 **Replace all drip trays and cabinet covers.**

————— *End of Procedure* —————

Procedure 3**Adding expansion cabinets to an existing system**

- 1 Install an expansion daughter board and cable on the NTDK20 SSC in the main cabinet as described in “Chapter 12 – Installing the System Controller Card and Components” on page 131**
- 2 Install expansion cabinets.**
Refer to Procedure 2, “New system installation” on page 98.
- 3 Connect the main and expansion cabinets together in a point-to-point configuration.**
- 4 Power up the main and expansion cabinets..**
- 5 Install (if not previously installed) and activate the telephones.**
Refer to “Chapter 19 – Connecting the telephones” on page 231.
- 6 Connect the trunks to the system as described in “Chapter 20 – Connecting the trunks” on page 259**
- 7 Perform a system backup, using overlay 43.**
- 8 Install any remaining equipment, such as external alarms (Refer to “Chapter 21 – Connecting an external alarm” on page 285)**
- 9 Replace all drip trays and cabinet covers.**

————— *End of Procedure* —————

Procedure 4

Reconfiguring existing cabinets to accomodate an additional expansion cabinet

Under certain circumstances it is necessary to rearrange cabinet connections and/or configurations. Two such scenarios are detailed below.

Scenario 1

If the existing main cabinet is equipped with two daughterboards, and the expansion cabinets are located within 10 m, adding another expansion cabinet within 3km requires the following steps:

- 1** Move the connection for the cabinet on port 1 of the lower daughterboard (cabinet 2) to port 2 of the top daughterboard.
- 2** Change the designations at the cross-connect terminal from cabinet 2 to cabinet 3.
- 3** Reassign in software all services provided on cards 21 to 30, to cards 31 to 40.
- 4** Replace the lower 10m expansion daughterboard with a 3 km expansion daughterboard.

Scenario 2

The existing main cabinet is equipped with two 10 m Dual Port expansion daughterboards connecting to three expansion cabinets. A remote expansion cabinet is to be added requiring a 3 km expansion daughterboard. Although one of the existing daughterboards has a port available, it can only be connected to a cabinet within 10 m (33 ft.). With this scenario, do the following:

- 1** Select the Dual Port expansion daughterboard that is being used for only one cabinet (a spare port is available on the daughterboard).
- 2** Replace it with a 3 km Dual Port expansion daughterboard.
- 3** Replace the Receiver card in the existing companion expansion cabinet with a 3 km receiver card.
- 4** With glass optic cable, connect the existing expansion cabinet to the same port as previously assigned on the new expansion daughterboard.
- 5** Add the new cabinet to the remaining port as described in Procedure 3 on page 101.

----- *End of Procedure* -----

Chapter 9 – Mounting the cabinets

General information

This chapter explains the two methods of installing Option 11C main and expansion cabinets. They are described in the following procedures:

- Procedure 5, “Mounting the cabinet on a wall” on page 104
- Procedure 6, “Mounting the cabinet on the floor” on page 108

Earthquake bracing

If the Option 11C system cabinets require earthquake bracing, refer to “Earthquake bracing requirements” on page 38 before continuing.

Mounting the cabinet on a wall

Items required

To mount cabinets on a wall you need:

- the equipment layout plan as developed in the “Equipment layout plan” on page 56
- the mounting bracket supplied with each cabinet
- seven 1 in. #12 screws provided or other appropriate fasteners to secure the mounting bracket and cabinet to the wall
- a 3/4 in. (20 mm) sheet of plywood secured to the wall
- one 1 in. #12 screw and an alignment bracket if installing an expansion cabinet next to the main cabinet (horizontal expansion)

CAUTION

A fully loaded cabinet weighs up to 75 lb (34 kg). Make sure that the equipment is securely fastened to the wall. Use fasteners that are designed to hold securely in the type of surface chosen to support the equipment. When using 3/4 in. (20 mm) plywood or other similar material as a backboard, make sure that it is anchored directly to the wall studs in a minimum of six locations.

Procedure 5 **Mounting the cabinet on a wall**

Note: If adding a cabinet next to an existing installed cabinet, start at Step 4 on page 104.

- 1 Draw a level line on the plywood backboard indicating where the mounting brackets for each system cabinet will be located.**

Refer to the equipment layout plan for measurements, or refer to “Equipment layout plan” on page 56.
- 2 Locate the mounting bracket and mounting screws shipped with each cabinet.**
- 3 Reset the bottom of the bracket on the line drawn for the main cabinet and fasten the mounting bracket to the wall with five 1 in. #12 screws provided (or other suitable fasteners).**

Make sure the mounting bracket is even with the line you have drawn and that the hook on the bracket is facing upward as shown in Figure 28 on page 105.
- 4 Perform this step only if an expansion cabinet is to be located immediately next to the main cabinet (or an existing expansion cabinet). Otherwise, go to the next step (Step 5 on page 105).**

Fasten an alignment bracket (shipped with the cabinet) to the wall as shown in Figure 28 on page 105.

The alignment bracket determines the minimum distance between the main and expansion cabinets if mounted side-by-side. It is not required if the space between cabinets is significant.

Figure 28
Brackets for horizontal expansion

- 5** **Reset the bottom of the bracket on the line drawn for the expansion cabinet, and fasten the mounting bracket to the wall with five 1 in. #12 screws provided (or other suitable fasteners).**

Make sure the mounting bracket is even with the line drawn, and that the hook on the bracket is facing upward as shown in Figure 28 on page 105.

- 6** **Remove the main cabinet (or expansion cabinet if the main cabinet has been installed) from its carton and remove its front cover.**

If the front cover lock latches are in their locked position, use a screwdriver and turn the lug on each latch 90° to the unlocked position (Refer to Figure 29 on page 106).

Simultaneously slide both latches in towards the center of the cabinet.

Grasp the sides of the cover and pull the top outwards, then lift it upward to remove it from the cabinet.

Note: The bottom of the front cover is supported but not secured to the cabinet. Be careful not to drop it.

Figure 29
Unlocking the latches

7 Remove the metal drip tray.

Check the wrist strap in the bottom right of the cabinet. It may have come loose during transit. If so, attach it to the velcro tab on the inside right wall of the cabinet.

WARNING

An empty cabinet weighs 25 lb (12 kg). Get help to lift the cabinet if necessary.

- 8 Lift the cabinet and hang it on the mounting bracket hook.**
- 9 Locate the two screw holes at the bottom towards the rear of the cabinet. See Figure 30 on page 107.**
- 10 Adjust the cabinet so that it is straight and level. Fasten the bottom of the cabinet to the wall with the two 1 in. # 12 screws provided with the cabinet.**

Figure 30
Securing the cabinet to the wall

- 11** If additional expansion cabinets are being installed at this site, repeat Steps 6 through 10 to install those cabinets.

————— *End of Procedure* —————

Mounting the cabinet on the floor

Items required

To mount the cabinet on the floor you need:

- the optional pedestal for floor mounting (NTBK27)
- four #14 screws provided to secure the cabinet to the pedestal
- the equipment layout plan as developed on page 56.

WARNING

An empty cabinet weighs 25 lb (12 kg). Get help to lift the cabinet if necessary.

Procedure 6

Mounting the cabinet on the floor

- 1 Remove the main cabinet (or expansion cabinet if the main cabinet has been installed) from its carton and remove its front cover.**

If the front cover lock latches are in their locked position, use a screwdriver and turn the lug on each latch 90° to the unlocked position (Refer to Figure 31 on page 109).

Simultaneously slide both latches in towards the center of the cabinet.

Grasp the sides of the cover and pull the top outwards, then lift it upward to remove it from the cabinet.

Figure 31
Unlocking the latches

Note: The bottom of the front cover is supported but not secured to the cabinet. Be careful not to drop it.

2 Remove the metal drip tray.

Check the wrist strap in the bottom right of the cabinet. It may have come loose during transit. If so, attach it to the velcro tab on the inside right wall of the cabinet.

3 Locate the carton containing the pedestal.

Remove the pedestal from the carton and locate the four leveling feet. Install the feet into the base of the pedestal.

4 Install the cabinet on the pedestal.

Lean the cabinet backwards. From under the cabinet and with a pair of pliers, break off the two tabs located in the openings on the bottom of the cabinet where the door hinges join the cabinet as shown in Figure 32 on page 110.

Figure 32
Installing the pedestal

Place the cabinet on the pedestal and make sure that it is properly seated. Align with the guide at the rear of the cabinet and pedestal (Refer to Figure 33 on page 111).

Install the four #14 screws that are shipped with the pedestal, two at the bottom rear and two where the tabs were removed, and secure the cabinet to the pedestal. Opening for door hinge (one on each side of cabinet)

Figure 33
Mounting the cabinet on the pedestal

- 5** **Position the cabinet according to the equipment layout plan.**
- 6** **If an additional expansion cabinet is being installed at this site, repeat this procedure for that cabinet.**

————— *End of Procedure* —————

Chapter 10 – Installing the system ground

General information

This chapter describes how to install and connect the ground source to the Option 11C cabinets. This chapter contains the following procedures:

- Procedure 7, “Grounding the cabinets” on page 114
- Procedure 8, “Earthing the cabinets (UK)” on page 118

Note: System ground is synonymous with system earth in the UK.

Make sure you read, “Grounding requirements” on page 39, before proceeding further.

WARNING

Proper grounding is extremely important.

Failure to complete the following steps could result in a system that is:

- unsafe for personnel using the equipment
- not protected from lightning or power surges
- subject to service interruptions.

Insulated ground wire **must** be used for system grounding.

Cabinets powered by the same service panel

For each system cabinet in collocated multi-cabinet situations, a #6 AWG (#40 Metric Wire Gauge) ground wire is connected from the cabinet to an NTB80 ground bar. The ground bar is in turn connected to a ground source (the ground bus in the AC service panel).

Cabinets powered by different service panels

For each system cabinet in collocated multi-cabinet situations, a #6 AWG (#40 Metric Wire Gauge) ground wire is connected from the cabinet to an NTB80 ground bar. If any cabinet cannot be powered from the same service panel, it must be grounded separate from the others back to the service panel that supplies it.

Grounding instructions for cabinets

The following procedure describes how to ground Option 11C cabinets. Repeat the steps for each cabinet installed in the system.

Procedure 7 Grounding the cabinets

- 1 **If the cabinet is equipped with a power supply unit, make sure that the AC power cord is disconnected from the power outlet.**

WARNING

Power should never be connected to a cabinet that is not properly grounded.

- 2 **If the cabinet is connected to a reserve power supply unit (battery backup), make sure that the circuit breaker on that unit is set to OFF.**

WARNING

Backup power should never be connected to a cabinet that is not properly grounded.

- 3 **If not previously installed, install an NTB80 ground bar near the cabinet.**

Note: The ground bar is intended to be used as a convenient bridging point for ground wires from up to three nearby Option 11C cabinets. Additional ground bars are required for remote cabinets, or when more than three cabinets are co-located.

- 4 Install a #6 AWG (# 40 Metric Wire Gauge) ground wire from the ground lug in each cabinet to the NTB80 ground bar (which is in turn connected with #6 AWG wire to the ground bus in the AC power service panel).**

Connect the ground wire to the ground lug located in the bottom of the cabinet next to the cable connectors (Refer to Figure 35 on page 117).

Route the ground wire through the third groove from the left in the bottom of the cabinet.

Connect the ground wire to the ground bar (Refer to Figure 34 on page 116).

Place a DO NOT DISCONNECT tag on the ground wire.

- 5 Connect the grounding block to a suitable ground source (the ground bus in the AC power service panel).**

WARNING

The connection in the AC power service panel should be performed by a qualified technician or electrician.

- 6 Place a DO NOT DISCONNECT tag on the ground wire at the service panel.**

————— *End of Procedure* —————

Figure 34
NTBK80 grounding block

Figure 35
Ground/Earth lug in the NTAk11 system cabinets

Procedure 8
Earthing the cabinets (UK)

- 1 Connect a protective and functional earth wire from the earthing strip on the test jack frame to the earth at the building entry point.**

Use a green/yellow wire no thinner than 10 mm².

- 2 In each cabinet, connect an earth wire from the earth lug in the cabinet (see Figure 35 on page 117) to the earth connection at the Test Jack Frame.**

Use a green/yellow wire no thinner than 10 mm². Route the earth wire through the third groove from the left in the bottom of the cabinet. Place a DO NOT DISCONNECT tag on the earthing wire.

- 3 Measure the resistance of the earth between the test jack frame and the main cabinet frame earth.**

The resistance should be no more than 0.25 Ω at 30 amperes.

————— *End of Procedure* —————

Chapter 11— Installing the power supplies

General information

This chapter describes how and where to install the power supplies used in the Option 11C system.

Figure 36
Power supply location — main and expansion cabinets

Power supplies

Power supplies are shipped separate from the cabinets.

AC- powered system

If installing an AC-powered system, an NTDK78 ac/dc power supply is required with its appropriate line cord for each cabinet.

DC-powered system

If installing a DC-powered system, an NTDK72 DC power supply is required for each cabinet.

Additionally, one NTAK0420 power cable is required for each cabinet (for a DC power source).

Switch settings

The power supplies are equipped with a series of switches which must be set before the units are installed in the cabinet (Refer to Figure 37 on page 121).

Figure 37
NTDK72 and NTDK78 power supply switch settings

	SW1	SW2	SW3	SW4
Message Waiting				
-150V	ON			
-120V	OFF			
Ringing				
86VRMS		OFF	OFF	OFF
80VRMS		ON	OFF	OFF
75VRMS		OFF	ON	OFF
70VRMS		OFF	OFF	ON

Frequency	Setting
50 Hz	
25 Hz	
20 Hz	

Switches located at top inside unit
 Set switch in lower position for ON

Example:

The setting for North America is normally:

-150V for message waiting

and

86VRMS 20 Hz for ringing

AC power supply installation

AC power requirements

The AC-powered version requires a non-switched dedicated power outlet installed within 6 ft (1830 mm) of each cabinet, with:

- one non-switched dedicated outlet per cabinet with:
 - Voltage: Recommended 100 to 240 volts
Maximum limits 90 and 250 volts
Single phase
 - Frequency: 50 or 60 Hz
 - Power (I/P Max): 750VA

Refer to “Commercial power requirements” on page 43 for detailed information about power requirements.

WARNING

Wait at least five minutes after power to the unit is switched off before removing the unit from the cabinet. Make sure that the power cord and battery backup connection (if equipped) are both disconnected.

CAUTION

The NTDK78 ac/dc power supply cannot power up on battery alone. If the NTDK78 is powered down while operating on DC reserve power, then AC power is required to power up.

Procedure 9

Installing the AC power supply

- 1 Set the AC breaker on the front of the power supply to the OFF position.
- 2 Make sure that the switches on the power supply are properly set as shown in Figure 37 on page 121.
- 3 Insert the power supply into the first slot on the left of the card shelf (refer to Figure 36 on page 119).

- 4 Lock it into place with the card tabs.
- 5 Attach the power line cord to the connector on the left side of the power supply (see Figure 38 on page 123) by feeding the cord up through the card guides.

Figure 38
AC power cable connection

- 6 Secure the power line cord in place using the clip at rear of cabinet, see Figure 38 on page 123.
- 7 Route the rest of the power line cord down through the opening at the bottom of the cabinet.

- 8 **Test the ground of each system cabinet using the following:**
- a Set the circuit breakers feeding the AC outlet used to power the cabinet to OFF.

b Connect the power line cord to the NTDK78 main cabinet power supply.

c Using an ohmmeter, measure the resistance from the ground pin on the line cord to the ground receptacle on the AC outlet.
- The resistance must be less than 0.25 Ohms.

If the cabinets are powered from different service panels, the ground must be traced back to the panel serving the cabinet.
- d Reset the circuit breaker once the ground connection is verified.

————— *End of Procedure* —————

DC power supply installation

Figure 39
DC power requirements

	Minimum (see note)	Nominal	Maximum
Recommended	-42.5 V dc	-52 V dc	-54 V dc
Limits	-42.5 V dc	-52 V dc	-57 V dc
Noise (CMESS)	—	—	25 dBnc
Current	—	—	12 Amps
AC Ripple	—	—	100 mv RMS

Note: The NTDK72 DC breaker will trip
at -42.5 +/- 1.0Vdc.

Refer to the “DC-powered version” on page 51 for detailed information about DC power requirements.

Procedure 10**Installing the DC power supply**

- 1 Make sure the switches on the power supply are properly set. Refer to Figure 37 on page 121 of this chapter.**
- 2 Insert the power supply into the first slot on the left of the card shelf (refer to Figure 36 on page 119).**

CAUTION

Make sure the circuit breaker on the faceplate of the power supply is OFF before continuing.

- 3 Lock the power supply into place with the card tabs.**
- 4 If a rectifier is to be installed with the system, install it using the instructions supplied with the rectifier.**
- 5 Feed one end of the DC power cable up through the card guide and insert it into the connector on the right side of the DC power supply. See Figure 40 on page 126.**

Figure 40
NTDK72 DC power cable connection

- 6** Route the rest of the power cable down through the opening at the bottom of the cabinet as shown in Figure 41 on page 127.

Figure 41
Power cord routing

- 7** **Mount the NTAK28 Breaker Assembly to the wall within 3 ft (915 mm) of the cabinet it is serving. See Figure 42 on page 128.**

Secure the breaker assembly with four #10 1/2 in. (15 mm minimum) wood screws.

Note: One NTAK28 Breaker Assembly is required for each cabinet.

Figure 42
NTAK28 Breaker Assembly location

- 8 Set the breakers on the NTAk28 Breaker Assembly and on the NTDK72 power supply to OFF.
- 9 Connect the other end of the DC power cable (NTAk0420 cable) to the connector on the DC breaker assembly.
- 10 Connect the NTAk28 Breaker Assembly to a rectifier or other DC power source as shown in Figure 43 on page 129.

----- *End of Procedure* -----

Figure 43
Power connection at the NTA28 breaker assembly

Chapter 12 – Installing the System Controller Card and Components

General information

This chapter describes how and where to install the system controller card and components as required in the Option 11C system. It includes information relevant to the Main and Fiber Expansion cabinets.

Main Cabinet NTDK20 SSC Installation

This section describes the steps to install an SSC card in an Option 11C Main cabinet. It also describes the installation of the daughterboards, cables and other components that are required installation on the main cabinet SSC card.

SSC card, Boot code and Software Daughterboard compatability

If the software daughterboard is an NTDK21, there are no compatability issues and the installation can proceed.

If the software daughterboard is an NTDK81 or NTTK13, the boot code version of the NTDK20 card must be REL 09 or higher. To update the boot code, refer to the *Option 11C and 11C Mini Upgrade Procedures*, NTP 553-3021-250.

Software Daughter Board and Security Device Installation

CAUTION

The NTDK20 SSC card is equipped with components on both sides of the circuit board. Be careful not to damage any of the components when handling the card.

Procedure 11

Installing the Software Daughterboard and Security Device

- 1 Put on the anti-static wrist strap.
- 2 Place SSC card on a clean flat surface.
- 3 Install the Software Daughterboard on the connector as shown in Figure 44 on page 133.
- 4 Press firmly on the standoffs to ensure that the card is secured to the SSC.
- 5 Insert the Security Device labeled NT_STD in the socket with the device markings facing outwards as shown in Figure 44 on page 133.

————— *End of Procedure* —————

Figure 44
Location of Software Daughterboard and Security Device on the NTDK20
SSC card

Expansion Daughter Boards and Cables installation

A single or dual port fiber expansion daughterboard is required on the SSC card of the main Option 11C cabinet for each expansion cabinet in the system. If you are installing three or more expansion cabinets, you will need to install two dual-port fiber expansion daughterboards.

The NTDK22 single-port fiber expansion daughterboard can be installed on all versions of the NTDK20 SSC. The NDTK85 dual-port fiber expansion daughterboard can be installed only on the NTDK20CA and later versions of the SSC card. Refer to Figures 6 and 9 in “Chapter 2 — Equipment identification” on page 17.

WARNING

The fiber optic interface product used in Option 11C is considered safe. However, as a precaution do not view the optical port or the end of fiber optic cable. Under certain conditions (such as during cable testing or under light magnification) the cable or port may expose the eye beyond the limits of Maximum Permissible Exposure recommended in some jurisdictions. Do not remove protective caps or plugs until ready to connect the cable.

Installing Fiber Expansion Daughterboards

Procedure 12

Installing the Single or Dual Port Fiber Expansion daughterboards on the SSC card.

- 1 Put on the anti-static wrist strap.**
- 2 Place SSC card on a clean flat surface.**
- 3 Install the Fiber Daughterboard for expansion cabinet(s) 1 and 3 on the connector as shown in Figure 45 (the upper connector).**
- 4 Install the Fiber Daughterboard for expansion cabinet(s) 2 and 4 on the connector as shown in Figure 45 (the lower connector).**

Note 1: If using plastic fiber optic cable, see also Procedure 13 on page 137.

Note 2: If using glass fiber optic cable, see also Procedure 14 on page 142.

- 5 Press firmly on the standoffs to ensure that the card(s) are secured to the SSC.
- 6 Connect the fiber optic cable to the Fiber Receiver card as described in Procedures 13 and 14 of this chapter.
- 7 Insert the NTDK20 SSC card into slot “0” of the main Option 11C cabinet. Make sure to lock the latches securely.
- 8 Route the fiber optic cable through the Cable Routing Guide in the main cabinet.

Be sure to wrap the cable one complete loop around the Cable Routing Guide (shown in Figure 46 on page 136) to allow extra cable for removing the SSC card later.

End of Procedure

Figure 45
Cabinet assignments on Dual Port Daughterboards (both types of daughterboards are shown)

Figure 46
Cable Routing Guide

Installing Fiber Daughterboard Cables

An A0632902 10 m fiber optic cable is used to connect the main cabinet to an expansion cabinet located within 10 m (33 ft).

A glass fiber optic cable, supplied and installed by a local facilities provider, can be used to connect an expansion cabinet located up to 3 km (1.8 mi) from the main cabinet.

Do not staple or twist fiber optic cable.

Do not bend it beyond a minimum 35 mm bend radius (90° soft bend).

CAUTION

Incorrectly connected fiber optic cables may cause the following problems:

- a series of repetitive fault indicating messages
- a complete failure of the expansion cabinet.

If fault indicating messages appear, check the fiber optic cable connections.

Since messages are stored in a buffer, they may continue to be displayed until the buffer is empty. After checking the cable connections, wait a couple of minutes for the messages to stop.

Procedure 13

Installing the A0632902 10m fiber optic cable:

- 1 Put on the anti-static wrist strap**
- 2 Place SSC card on a clean flat surface.**
- 3 Remove the protective plugs from the connectors on the Fiber Daughterboard.** Refer to Figure 47 on page 138.
- 4 Connect the cable from the Fiber Receiver card to the Fiber Daughter Board.**

Figure 47
NTDK85 Dual Port Fiber Expansion Daughterboard

- 5 Insert the connector firmly as shown in Figure 48 on page 139. A distinct ‘snapping’ is felt when the connector is properly seated and the clasps are engaged.

Note 1: The ‘V’ shaped groove on the cable connector is facing outward when the connector is fully seated. See Figure 49 on page 140.

Note 2: The mark (if equipped) on the sides of the cable connector should not be visible when properly connected. Refer to Figure 49 on page 140

- 6 Route the cables through the SSC cable routing guide as shown in Figure 50 on page 141

————— *End of Procedure* —————

Figure 48
Plastic fiber optic connection

Figure 49
Plastic Fiber Cable Connection

Figure 50
Fiber Optic Cable Connection

Procedure 14

Installing glass fiber optic cable:

- 1 Put on the anti-static wrist strap.**
- 2 Place SSC card on a clean flat surface.**
- 3 Remove the protective plugs from one connector on the Fiber Daughterboard.**
- 4 Remove the protective cap from the corresponding plug (Tx or Rx) on the glass fiber optic cable.**
- 5 Insert the plug in its designated connector on the daughterboard. Once inserted, lock the connector in place by turning it a half turn clockwise. Refer to Figure 51 on page 143.**
- 6 Repeat the steps for the remaining connector and plug**
- 7 Route the cables through the SSC cable routing guide as shown in Figure 46 on page 136.**

————— *End of Procedure* —————

Figure 51
Glass fiber optic connection

Figure 52
Glass Fiber Optic Cable Connection

Figure 53
Fiber Receiver Card in slot 0 of the fiber expansion cabinet.

Chapter 13 – Installing and connecting cross-connect terminals to cabinets

General information

This chapter describes how to install and connect a cross-connect terminal to an Option 11C system, using either:

- a BIX cross-connect terminal
- a Reichle Masari cross-connect terminal, or
- a Krone Test Jack Frame

Note: Although the use of the BIX system is not mandatory, it is the recommended choice.

This chapter contains the following procedures:

- Procedure 15 “Installing the BIX cross-connect terminal” on page 149
- Procedure 16 “Installing the Reichle Masari cross-connect terminal” on page 151
- Procedure 17 “Installing the KroneTest Jack Frame” on page 153
- Procedure 18 “Connecting the cables” on page 155

Information about the BIX cross-connect system is found in the following publications:

- *BIX In-Building Cross-Connect System Material Description* (NTP 631-4511-100)
- *BIX In-Building Cross-Connect System Planning* (NTP 631-4511-150)
- *BIX In-Building Cross-Connect System Material Installation and Servicing* (NTP 631-4511-200)

Terminal block requirements

The cross-connect terminal requires sufficient connecting blocks to terminate the following:

- up to ten 25-pair cables from each cabinet.
 - Each slot that is equipped with a trunk or line circuit card requires a cable.
 - The connectors J1 through J10 correspond to slot numbers 1 through 10 in the main cabinet.
 - Connectors J1 through J10 correspond to slot numbers 11 through 20 in the first expansion cabinet.
 - Connectors J1 through J10 correspond to slot numbers 21 through 30 in the second expansion cabinet.
 - Connectors J1 through J10 correspond to slot numbers 31 through 40 in the third expansion cabinet.
 - Connectors J1 through J10 correspond to slot numbers 41 through 50 in the fourth expansion cabinet.
 - Allow for additional cables at the cross-connect terminal if any of the ten slots in each cabinet are initially left vacant.
 - If the NTAK19EC 2-port SDI cable or NTAK19FB 4-port SDI cable are not used with the NTAK03 or NTAK02 cards, then a 25-pair cable is required for each of these cards.
- nine conductors comprising the AUX cable from each cabinet.
- one 25-pair cable from each QUA6 PFTU.
- wiring from telephones and trunks.

WARNING

Always use caution when installing or modifying telephone lines. Avoid installing telephone wiring during a lightning storm. Never touch uninsulated telephone wiring unless the line has been disconnected at the network interface.

Installing the BIX cross-connect terminal

Procedure 15 describes how to install the BIX cross-connect terminal.

Procedure 15

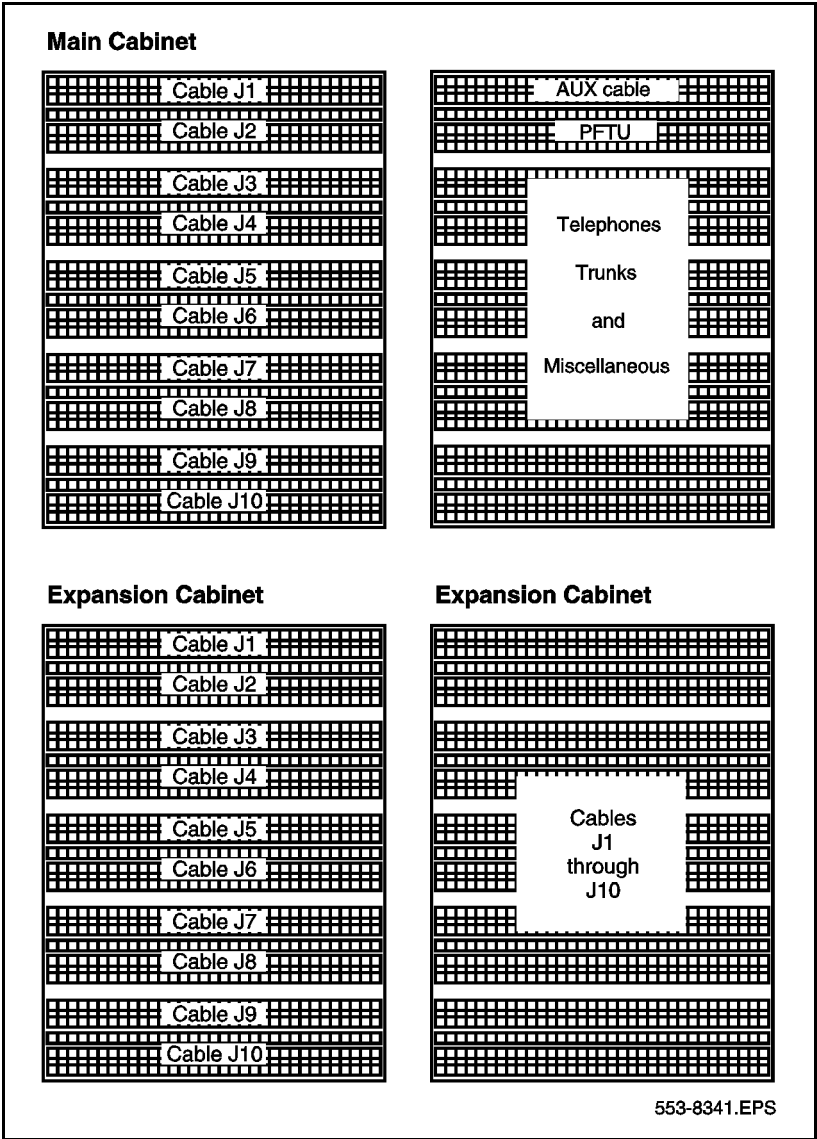

Installing the BIX cross-connect terminal

- 1 **Consult the equipment layout plan to determine where the cross-connect terminal should be located. Refer to “Chapter 3 — System and site requirements” on page 37.**
- 2 **Install the terminal blocks in a layout similar to that shown in Figure 54 on page 150.**
- 3 **Attach labels on the cross-connect terminal to indicate the terminal blocks assigned to:**
 - 25-pair cables from the cabinets
 - AUX wiring
 - Power fail transfer units
 - Telephones and consoles
 - Trunks
 - other miscellaneous equipment

Note: Refer to *BIX Installation and Servicing* (NTP 631-4511-200) for information about labels used with these terminal blocks

————— *End of Procedure* —————

Figure 54
Typical BIX cross-connect terminal layout

Installing the Reichle Masari cross-connect terminal (Germany)

Procedure 16 describes how to install the Reichle Masari cross-connect terminal.

Procedure 16

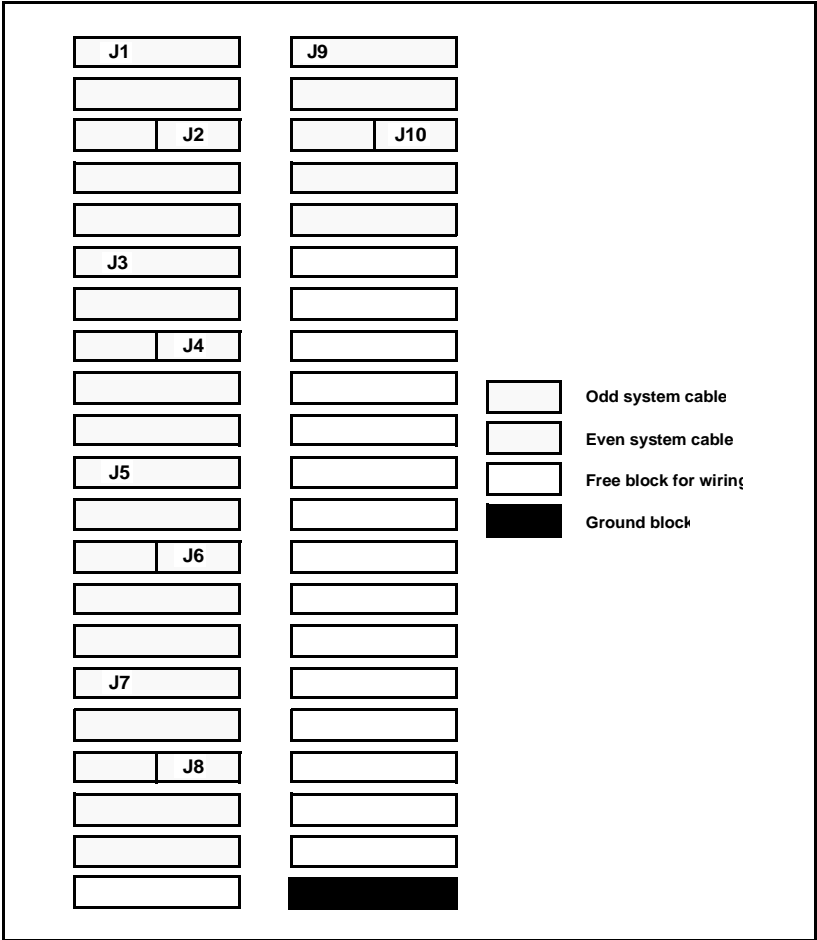

Installing the Reichle Masari cross-connect terminal

- 1 Consult the equipment layout plan to determine where the cross-connect terminal should be located. Refer to “Chapter 3 — System and site requirements” on page 37.**
- 2 Install the terminal blocks in a layout similar to that shown in Figure 55 on page 152.**
- 3 Attach labels on the cross-connect terminal to indicate the terminal blocks assigned to:**
 - 25-pair cables from the cabinets
 - AUX wiring
 - Power fail transfer units
 - Telephones and consoles
 - Trunks
 - Analogue line cards)
 - DC5/AC15/RAN/PAG cards
 - Data Access Cards
 - Digital line cards
 - Exchange line trunk cards
 - Direct Dialing Inward trunk cards
 - other miscellaneous equipment
- 4 Ground the cross-connect terminal**

Connect a 16 mm² (10 mm² green-yellow ground wire for Germany) ground wire from the ground bar on the cross-connect terminal to the ground lug in each cabinet.

————— *End of Procedure* —————

Figure 55
Reichle Masari cross-connect terminal layout (Germany)

Installing the Krone Test Jack Frame for the UK

Procedure 17 describes how to install the Krone Test Jack Frame

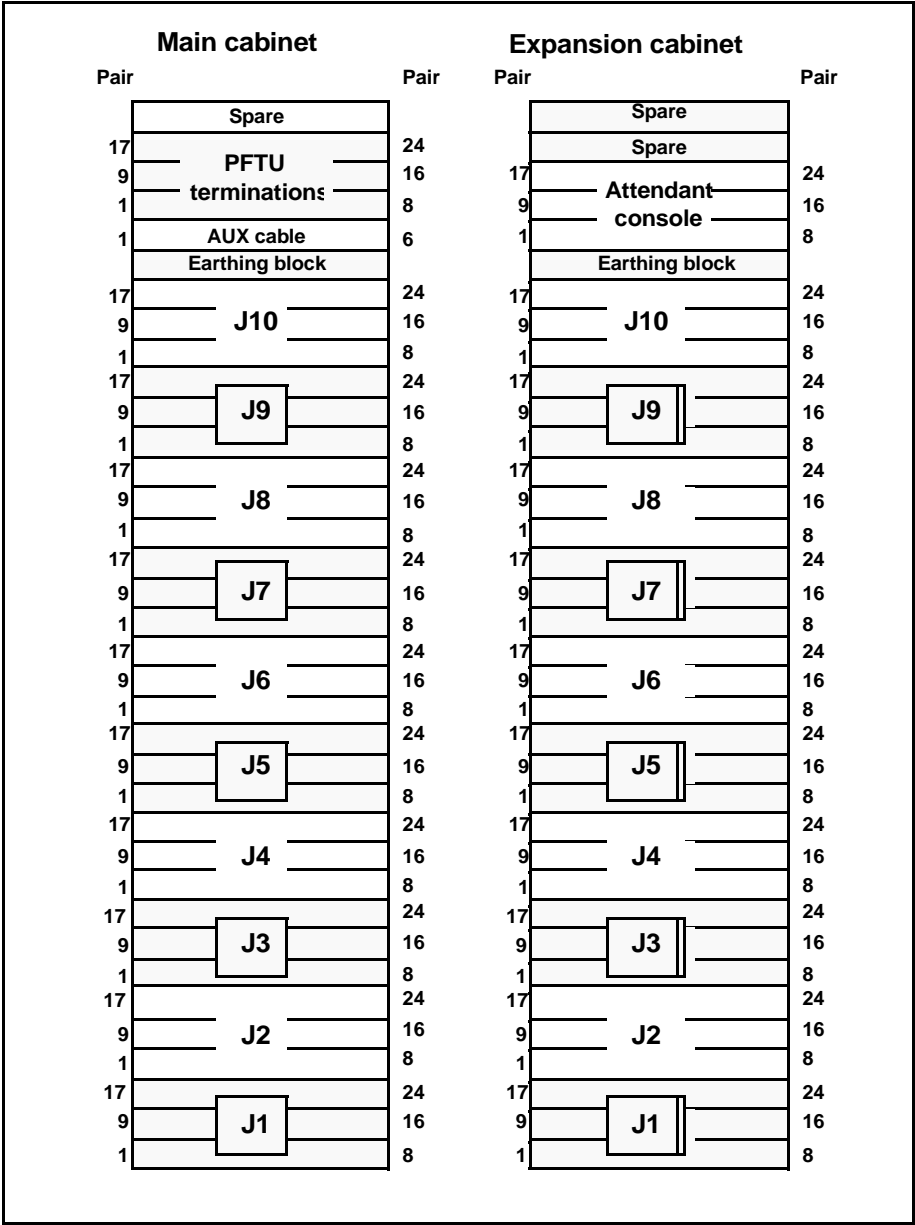

Procedure 17

Installing the KroneTest Jack Frame

- 1 Consult the equipment layout plan to determine where the cross-connect terminal should be located. Refer to “Chapter 3 — System and site requirements” on page 37.**
- 2 Install the terminal blocks in a layout similar to that shown in Figure 56 on page 154.**
- 3 Attach labels on the cross-connect terminal to indicate the terminal blocks assigned to:**
 - AUX wiring
 - Power fail transfer units
 - Telephones and consoles
 - Analogue line cards
 - DC5/AC15/RAN/PAG cards
 - Data Access Cards
 - Digital line cards
 - Exchange line trunk cards
 - Direct Dialing Inward trunk cards
 - other miscellaneous equipment

————— *End of Procedure* —————

Figure 56
Typical Krone cross connect terminal layout

Connecting the cables

Each Option 11C system cabinet requires up to ten 25-pair cables. Each cabinet requires an additional terminal block at the cross-connect terminal for the termination of the 9-pin conductor auxiliary cable.

All cables are connected at the bottom of the cabinet and are routed through the openings in the lower part of the cabinet.

Note: Care must be taken when using NE-A25B cables with the NTAK02, and NTAK03 cards, as these cables are not wired out to station equipment or trunk circuits.

For 1.5 Mb and 2.0 Mb DTI/PRI related wiring and cabling information, refer to Option 11C *1.5Mb DTI/PRI Administration and Maintenance Guide*, 553-3011-310, and Option 11C *2.0Mb DTI/PRI Administration and Maintenance Guide*, 553-3011-315.

Procedure 18 Connecting the cables

- 1 Remove the connector retaining bar from the connector panel in the lower part of each cabinet. See Figure 57 on page 156.**
- 2 Using the card slot allocation plan, connect a 25-pair cable to each of the connectors that will contain a line or trunk card.**

Make sure to tag both ends of each cable with the cabinet and connector numbers.

Note: Do not use the NE-A25B cable with the NTAK10, NTAK79, or NTBK50 circuit cards.

Figure 57
Cable connectors in a system cabinet

- 3** Route the cables down through the opening at the bottom of each cabinet.
- 4** Replace the retaining bar when you have connected all the cables to the cabinet.
- 5** Terminate all the 25-pair cables installed at the cross-connect terminal.

Label all the cables at the cross-connect terminal blocks according to the card slot allocation plan.

- 6** Install the AUX cable on the lower 9-pin connector located on the left side of the connector area in the lower part of each cabinet.

Terminate the AUX cable at the cross connector located on the left side of the connector according to Figure 58 on page 157.

————— *End of Procedure* —————

Figure 58
Table of AUX cable terminations

Color	Wire number	Designation	Connection
W-BL	1	BRTN	to QUA6-J1 1R
BL-W	2	BRTN	to QUA6-J1 2R
O-W	3	-48V AUX (250mA)	to QUA6-J1 25T, 25R
W-O	4	PFTS	to QUA6-J1 2T
G-W	5	-15V AUX	Console power*
W-G	6	+15V AUX	Console power*
* Each AUX cable can provide power for only one console.			

Chapter 14 – Installing power fail transfer units

General information

Procedure 19 on page 160 of this chapter describes how to install a QUA6 Power Fail Transfer Unit (PFTU).

PFTUs can be connected to the expansion cabinets as well as to the main cabinet.

Note: The QUA6 Power Fail Transfer Unit operates with loop-start and ground-start CO trunks. However, with ground-start trunks the associated telephone set must be equipped with a ground-start button.

If Power Fail Backup is required as a fail safe for this system, use analog trunks since digital trunks are not supported by a PFTU.

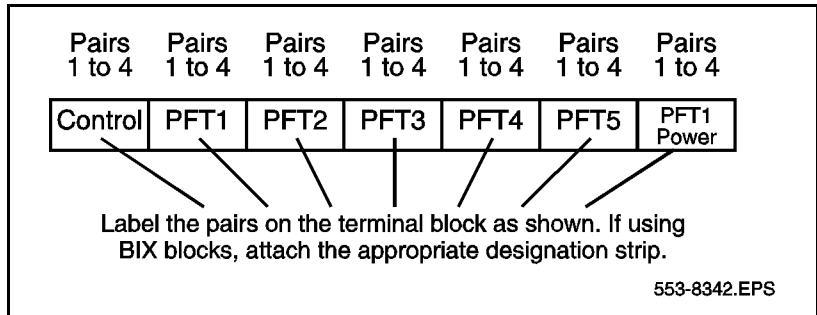

Installing the PFTU

Consult the equipment layout plan to determine where the PFTU should be located.

Procedure 19 Installing the PFTU

- 1 Mount the PFTU on the wall near the system cross-connect terminal and secure it with four screws.
- 2 Install an NE-A25B-type 25-pair cable from connector J1 on the faceplate of the PFTU to its assigned location at the cross-connect terminal.
- 3 Label the pairs of the J1 cable on the cross-connect terminal block as shown in Figure 59 on page 160.

Figure 59
J1 cable labeling

- 4 Connect the PFTU power and control connections to the AUX cable (see Figure 60 on page 161) from the cabinet (Refer to Table 16, “Control and power connections on cable J1,” on page 162).

Figure 60
Auxiliary port location

Table 16
Control and power connections on cable J1

J1 Cable from QUA6 (see Figure 61 on page 163)				
Function	Pair Number	Pair Color	Connects to	Cross-connect to
Control	1T	W-BL	(ALM)	Not used.
	1R	BL-W	BRTN	W-BL 1-dot connection on AUX cable from the cabinet
	2T	W-O	PFTS	W-O 1-dot connection on AUX cable from the cabinet. Transfer initiated by applying ground to this lead.
	2R	O-W	BRTN	BL-W 1-dot connection on AUX cable from the cabinet
	3T	W-G	(TC)	Console transfer switch. See console connections. Transfer initiated by applying ground to this lead.
	3R	G-W		Not used.
	4T	W-BR		Not used.
	4R	BR-W		Not used.
PFTU Power	25T 25R	S-V V-S	-48 V -48 V	O-W 1-dot connection on AUX cable. Maximum 250 mA draw on O-W lead.

5 Connect the attendant console to the PFTU:

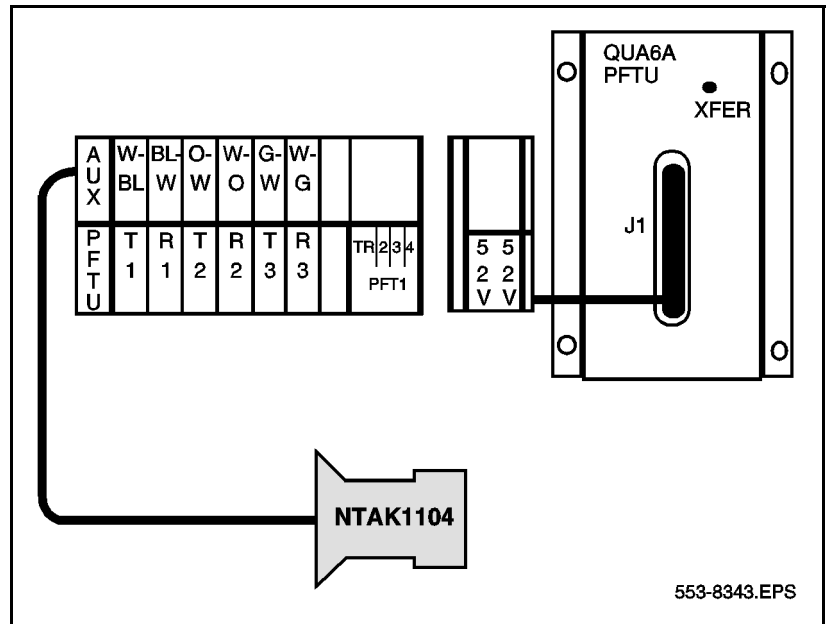

- attendant console 14 Tip (14T) to ground
- 3 Tip (3T) of PFTU to 11 Ring (11R) of attendant console (power fail transfer switch)
- attendant console 11 Tip (11T) to ground.

If power to the M2250 attendant console is not provided by two Digital Line card TNs, connect;

- G-W of AUX to 8 Tip (8T) of attendant console (-15 volts),
- W-G of AUX to 7 Tip (7T) of attendant console (+15 volts).

————— *End of Procedure* —————

Figure 61
Power Fail Transfer

PFTU control lead signals

To connect PFTUs from other manufacturers, use the information provided in the following table:

Table 17
PFTU control lead signals

NTAK1104 Aux. Cable Lead	Lead State when PFTU in Non-Transferred State	Lead State when PFTU in Transferred State
BRTN	GROUND	GROUND
BRTN	GROUND	GROUND
-48V AUX	-48V DC (250 mA max.)	-48V DC (250 mA max.)
PFTS	OPEN	GROUND

Note 1: Refer to Figure 60 on page 161 for an illustration of where the Auxiliary cable connects to the Option 11C system.

Note 2: If power is removed from the QUA6, a transfer of the PFTU may also be invoked.

Chapter 15 – Installing the circuit cards

General information

This chapter describes how and where to install various circuit cards available to use in the Option 11C system. This chapter does not include information on the Main SSC card and its Fiber Receiver counterpart. For information on these cards, refer to “Chapter 12 – Installing the System Controller Card and Components” on page 131.

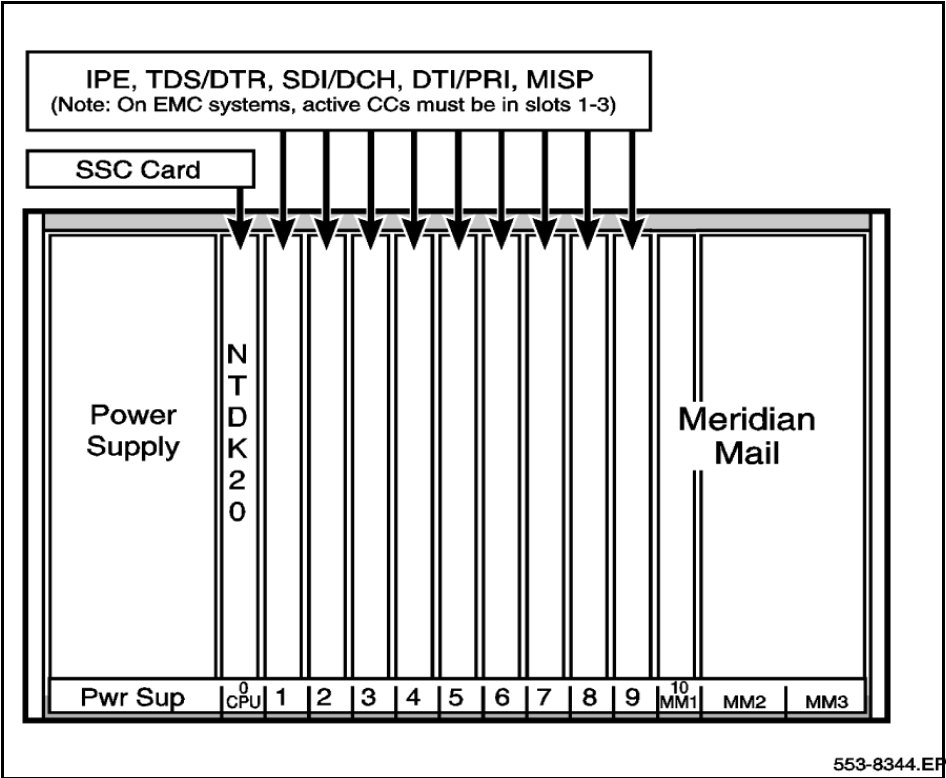

Always handle circuit cards with care to avoid damaging them due to static electricity. Always store unused circuit cards in an anti-static bag or the original packaging.

CAUTION

An anti-static wrist strap, provided in the bottom of the cabinet, must be worn when handling circuit cards. Static electricity can damage the components of circuit cards.

Figure 62 on page 166 and Figure 63 on page 167 show the shelf assignments for the circuit cards in the Option 11C Main and Expansion cabinets.

Figure 62
Shelf assignments — Option 11C Main Cabinet

Note: DTI/PRI and TDS/DTR circuit cards must reside in the main cabinet, slots 1 to 9. The Meridian Mail option, if it is to be equipped, requires slot 10 in the main cabinet.

Figure 63
Shelf assignments —Option 11C Fiber Expansion Cabinets

Circuit cards

A circuit card displaying a symbol of a switch on its faceplate is equipped with option switches or strapping plugs or both. Other circuit cards, such as the NTDK20 Small System Controller (SSC) card, are capable of mounting daughterboards and other add-on devices. Refer to “Chapter 12” for information on installing the NTDK20 card.

The following circuit cards are commonly used in the Option 11C system. A complete list of circuit cards requiring settings can be found in the *Circuit Card Installation and Testing* document, NTP 553-3001-211.

NTAK02 SDI/DCH card

Before inserting the NTA02 SDI/DCH card into its slot, you must set the switches and attach the jumper plugs.

Note: This circuit card can only be installed in the main cabinet.

The NTA02 SDI/DCH switches allow you to configure the four SDI ports as a combination of the following:

- SDI
- ESDI
- OR**
- DCH/DPNSS.

The NTA02 SDI/DCH card uses jumper plugs to configure the RS232/RS422 interfaces as:

- DTE
- OR**
- DCE.

Procedure 20
NTAK02 circuit card installation

- 1 Set the switches and jumper plugs for the NTA02 SDI/DCH card according to the following tables.**

Table 18
Switch settings

Port 0	Port 1	SW 1-1	SW 1-2
SDI	DCH	OFF	OFF
SDI	DPNSS	OFF	ON
—	ESDI	ON	ON

Table 19
Switch settings (continued)

Port 2	Port 3	SW 1-3	SW 1-4
SDI	DCH	OFF	OFF
SDI	DPNSS	OFF	ON
—	ESDI	ON	ON

Table 20
Jumper settings

Port	Jumper location	Strap for DTE	Strap for DCE	Jumper location	RS422	RS232
Port 0	J10	C - B	B - A			
Port 1	J7 J6	C - B C - B	B - A B - A	J9 J8	C - B C - B	B - A B - A
Port 2	J5	C - B	B - A			
Port 3	J4 J3	C - B C - B	B - A B - A	J2 J1	C - B C - B	B - A B - A

2 Insert the card in its assigned slot.

The NTAK02 SDI/DCH card may be installed in card slots 1 through 10.

3 Connect an NTAK19FB four port cable (or an NE-A25-B cable) from the corresponding connector at the bottom of the cabinet. If using an NE-A25-B cable, terminate it at the cross-connect terminal (since the NTAK19FB cable is equipped with connectors, it does not require termination at the cross-connect terminal).

————— *End of Procedure* —————

NTAK03 TDS/DTR card

The function of the NTAK03 TDS/DTR card is provided on the NTDK20 SSC card. However, the TDS/DTR card can co-exist with the SSC card if you wish to access extra TDS/DTR units or SDI ports. These functions must be manually programmed in the software overlays.

Note: The system may not operate properly if an NTAK03 circuit card is installed in a slot connected to telephones. Refer to Chapter 11 *Installing and connecting SDI ports to terminals and modems* to connect an NTAK03 circuit card to the cross-connect terminal.

Procedure 21 NTAK03 card installation

1 Insert the card in its assigned slot.

The NTAK03 TDS/DTR card may be inserted into any of the card slots 1 through 9.

2 Connect an NTAK19EC cable (or an NE-A25-B cable) from the corresponding connector at the bottom of the cabinet. If you are using an NE-A25-B cable, terminate it at the cross-connect terminal (since the NTAK19EC cable is equipped with connectors, it does not require termination at the cross-connect terminal).

————— *End of Procedure* —————

NT8D14 Universal Trunk card

The universal trunk card provides eight analog trunks which can function in the modes shown in the following table.

This line card can be installed in slots 1 through 10 in the main cabinet or 11 through 30 in the expansion cabinets.

Procedure 22

Universal Trunk card installation

- 1 **Set the jumpers for the NT8D14 Universal Trunk circuit card according to the following table.**

Table 21

NT8D14 Universal trunk — modes and option settings

Modes	Location	Jumper strap
Central (CO)	J1, J2	OFF
2-way tie trunk (loop Dial Repeat)	J1, J2	OFF
2-way tie trunk (Outgoing Incoming Dial)	J1, J2	OFF
Recorded Announcement (RAN)	J1, J2	OFF
Paging trunk	J1, J2	OFF
Japan CO/DID operation	J1, J2	OFF
DID operation Loop length > 2000 $\frac{3}{4}$	J1, J2	ON
DID operation Loop length < 2000 $\frac{3}{4}$	J1, J2	OFF
Note: OFF indicates no strap present. J1 and J2 locations apply to all eight trunks.		

- 2 **Insert the card in its assigned slot.**

The NT8D14 Universal Trunk card may be installed in card slots 1 through 30.

————— *End of Procedure* —————

NT8D15 E&M Trunk card

This trunk card provides four trunks which can function as 2W E&M, 4W E&M, and Paging.

Procedure 23

E&M Trunk card installation

- 1 Set the switches (see the following table) for the NT8D15 E&M trunk circuit card according to the following table.

Table 22

NT8D15 E&M Trunk card option settings

Mode of operation	J2	J9
4W — Type 1	ON	connect pins 2 - 3
4W — Type 2	ON	connect pins 2 - 3
2W — Type 1	ON	connect pins 2 - 3
Paging trunk	ON	connect pins 2 - 3

- 2 Insert the card in its assigned slot.

The NT8D15 E&M Trunk card may be installed in card slots 1 through 30.

————— *End of Procedure* —————

NTAG26 XMFR card

The function of the XMFR (Extended Multi-Frequency Receiver) card is provided on the NTDK20 SSC card. However, this card can co-exist with the SSC card if you wish to access extra XMFR capability.

The XMFR card is used to receive MF digit information. Connections are made between a PBX and a CO. Features such as Automatic Number Identification (ANI), Meridian 911 (M911) and Feature Group D (FGD) are supported on the Option 11C by the IPE MF Receiver.

Procedure 24

XMFR card installation

1 Insert the NTAG26 card in its assigned slot.

The NTAG26 card can be installed in slots 1 through 30.

2 Configure and enable the card through overlay 13 and 34.

After the card is enabled, the LED will flash three times to indicate it is conducting a self-test. If the LED remains lit, then the self-test has failed.

————— *End of Procedure* —————

NT5K21 XMFC card

The function of the XMFC (Extended Multi-frequency Compelled Sender/Receiver) card is provided on the NTDK20 SSC card. However, this card can co-exist with the SSC card if you wish to access extra XMFC capability.

The XMFC card provides four channels of R2 Standard signalling capability.

Procedure 25 XMFC card installation

1 Insert the NT5G21 card in its assigned slot.

The card can be installed in slots 1 through 30.

2 Configure and enable the card through overlay 13 and 34.

After the card is enabled, the LED will flash three times to indicate it is conducting a self-test. If the LED remains lit, then the self-test has failed.

————— *End of Procedure* —————

NT1R20 Off-Premise Station (OPS) analog line card

The OPS analog line card provides eight OPS lines. The card can be installed in slots 1 through 10 in the main cabinet or 11 through 50 in the expansion cabinets.

Procedure 26

OPS Analog card installation

1 Set the jumpers on the NT1R20 OPS card.

Each line interface unit, on the card, is equipped with two jumper blocks that are used to select the proper loop current, depending upon loop length (Refer to Table 23 on page 176 and Figure 65 on page 177).

For units connected to loops of 460 to 2300 $\frac{3}{4}$, both jumper blocks for that unit must have jumper straps installed. For loops that are 460 $\frac{3}{4}$ or less, jumper straps are not installed.

Figure 64

Set the jumpers

2 Insert the OPS card in its assigned slot.

The card may be installed in card slots 1 through 50.

3 Cross connect off-premise telephones as described in “Chapter 20 – Connecting the trunks” on page 259.

Refer to Figure 66 on page 178 for cross connection information for the OPS card.

————— *End of Procedure* —————

Table 23
OPS analog line card configuration

Application	On-premise station (ONS)			Off-premise station (OPS)			
Class of service (Note 1)	ONS			OPS			
Loop resistance	0 - 460 ohms			0 - 2300 ohms			
Jumper strap setting (Note 6)	Both JX. 0 and JX.1 off			Both JX. 0 and JX. 1 off		Both JX. 0 and JX. 1 on	
Loop loss dB (Note 3)	0-1.5	>1.5-2.5	2.5-3.0	0-1.5	1.5-2.5	2.5-3.0	4.5-15
TIMP (Note 1, 4)	600¾	600¾	600¾	600¾	600¾	600¾	600¾
BIMP (Note 1, 4)	600¾	3COM1	3COM2	600¾	3COM1	3COM2	3COM2
Gain treatment (Note 5)	No						Yes
Note 1: Configured in the Single line Telephone Administration program (LD 10). Note 2: The maximum signaling range supported by the OPS analog line card is 2300 ohms. Note 3: Loss of untreated (no gain devices) metallic line facility. Upper loss limits correspond to loop resistance ranges for 26 AWG wire. Note 4: Default software impedance settings are: <u>ONS CLSOPS CLS</u> TIMP: 600 ohms 600 ohms BIMP: 600 ohms 3COM2 Note 5: Gain treatment, such as a voice frequency repeater (VFR) is required to limit the actual OPS loop loss to 4.5 dB, maximum. VFR treatment of metallic loops having untreated loss greater than 15dB (equivalent to a maximum signaling range of 2300 ohms on 26 AWG wire) is not recommended. Note 6: Jumper strap settings JX> 0 and JX. 1 apply to all eight units; “X” indicates the unit number, 0-7. “OFF” indicates that a jumper strap is not installed across both pins on a jumper block. Store unused straps on the OPS analog line card by installing them on a single jumper pin as shown below.							

Figure 65
OPS analog line card: jumper block locations

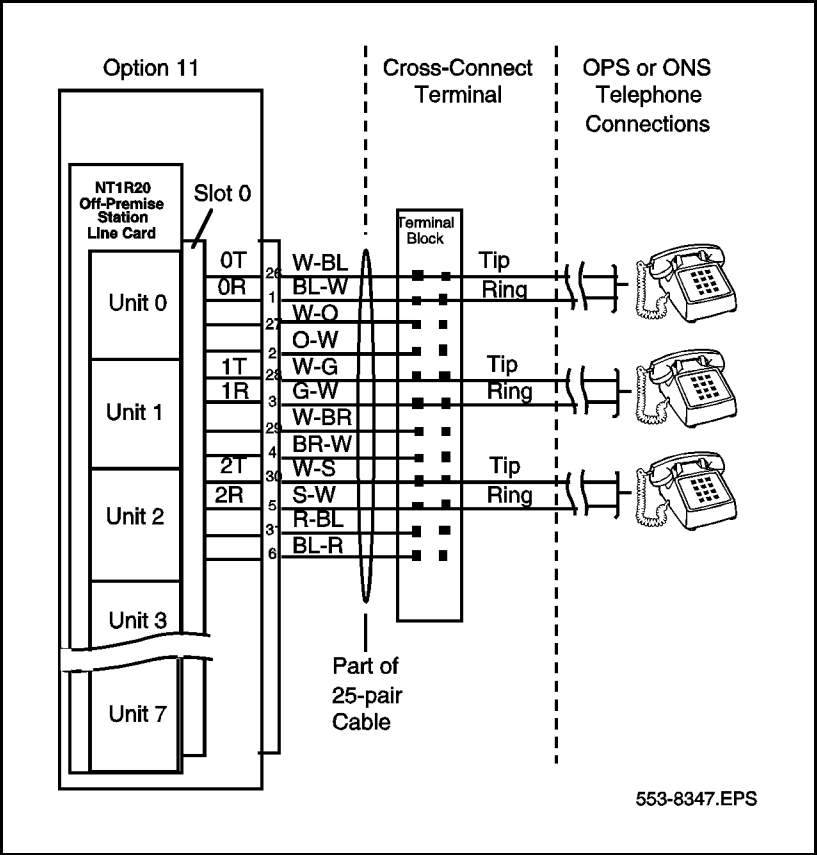

Figure 66
OPS analog line card cross connections

Chapter 16 – Installing and connecting reserve power supplies

General information

This chapter describes how to install and connect a reserve DC power supply to Option 11C cabinets.

If installing a multiple-cabinet system, each cabinet must have its own reserve power supply.

Types of reserve power

The types of reserve battery power are:

- The NTAK75 battery box, which has the following features:
 - designed to be float-charged by the NTDK78 ac/dc power supply
 - provides a minimum of 2 hours of reserve DC power
 - mounts to the floor
 - supports one system cabinet
- The NTAK76 battery box, which has the following features:
 - designed to be float-charged by the NTDK78 ac/dc power supply
 - provides a minimum of 15 minutes of reserve DC power
 - mounts to the wall
 - supports one system cabinet

- An Uninterruptible Power Supply (UPS) which will provide a continuous AC power supply. Install this unit according to the manufacturer's instructions.

CAUTION

If the NTDK78 ac/dc power supply is powered down while it is operating on DC reserve power from a battery backup unit, the Option 11C system cannot be powered up again until AC power is restored. Be careful not to open the circuit breaker, either on the battery backup unit or on the NTDK78, while the system is operating on battery backup.

Installing the NTAK75 battery unit

Follow the steps in Procedure 27 on page 180 to install an NTAK75 battery unit. Repeat the procedure for each system cabinet being installed.

Note: The system external ground must be installed before installing the battery backup unit.

Procedure 27 NTAK75 Battery Unit installation

- 1 Unpack the NTAK75 battery unit and place it according to the equipment layout plan.**
 - The battery unit must be installed within 3 ft (915 mm) of the cabinet it is serving.
 - Install to the side or below the Option 11C cabinet; not above.
 - If installed below, the minimum clearance from the top of the NTAK75 to the bottom of the wall mounted Option 11C cabinet is 2 ft (610 mm).
 - The battery unit should be installed in an open, well-ventilated area.
 - The area must meet the following temperature limits:

Maximum allowed range: 0 ° to 45° C (32 to 110°F)
Recommended range: 20 ° to 35° C (68 to 95 °F).
- 2 Remove its cover.**

The cover is secured by two captive screws on the front of the box.

- 3 **Set the switch on the top of the NTA75 battery box to OFF.**
- 4 **Unpack the batteries and check the expiry dates.**

If the batteries do not have the same dates, contact your supplier.

WARNING

The battery cells can deliver high currents when short-circuited. Make sure that you do not inadvertently short-circuit the terminals of the batteries.

- 5 **Place the individual batteries into the battery box (see Figure 67 on page 181).**

Figure 67
NTAK75 Battery Backup — Top View

6 Locate the four black/red jumper cables supplied with the NTAK75.

7 Connect the battery packs by installing the jumper cables between the +/- terminals of one battery pack to the connectors marked “J1 - J4.”

Any of the batteries may be attached to any connector (J1 - J4).

8 Ensure the jumper wires are securely fastened by pulling out on the tabs of the connector.

9 Switch the NTAK75 breaker to the ON position.

If the batteries are properly installed, the green LED will light. If this occurs, switch the breaker to OFF and proceed with step 10. If the LED does not light, return to Step 7 and check the wiring of the batteries.

10 Set the breakers on the NTAK75 or NTDK78 to OFF.

11 Plug the NTAK0420 cable from the battery box into the power supply in the cabinet (Figure 68 on page 183).

Secure the cable with the cable retainer inside the cabinet.

12 Set the breaker on the NTDK78 to ON. The BATT LED on the NTDK78 will remain off, indicating that the battery box breaker is OFF.

The LED on the NTAK75 will light indicating that the NTAK0420 cable connections are correct.

13 Set the breaker on the NTAK75 to ON.

The BATT LED on the NTDK78 will be lit.

14 Install the cover on the NTAK75.

————— *End of Procedure* —————

Figure 68
Cable connections

Installing the NTA76 battery unit

Follow Procedure 28 on page 184 to install an NTA76 battery unit. Repeat the procedure for each system cabinet being installed.

Note: The system external ground must be installed before installing the battery backup unit.

Procedure 28 NTA76 Battery Unit installation

- 1 **Unpack the NTA76 battery unit and place it according to the equipment layout plan.**
 - The battery unit must be installed within 3 ft (915 mm) of the cabinet it is serving.
 - The battery unit must be installed beside or below the Option 11C cabinet; not above.
 - If installed below, the minimum clearance from the top of the NTA76 to the bottom of the wall mounted Option 11C cabinet is 2 ft (610 mm).
 - The battery unit should be installed in an open, well-ventilated area.
 - The area must meet the following temperature limits:

Maximum allowed range: 0 ° to 45° C (32 to 110°F)
Recommended range: 20 ° to 35° C (68 to 95 °F)
- 2 **Remove the cover**

The cover is secured by one captive screw on the front of the box. (Refer to Figure 69 on page 185).
- 3 **Mount the battery unit to the wall using the four #8 3/4 inch wood screws provided with the unit.**

Install the center screw at the top of the battery unit. Level the unit and install the remaining screws.

Figure 69
Mounting the NTA76 battery unit to the wall

- 4 Set the switch on the front of the NTA76 battery box to OFF. (Refer to Figure 70 on page 186).**

WARNING

The battery cells can deliver high currents when short-circuited. Make sure that you do not inadvertently short-circuit the terminals of the batteries.

- 5 Unpack the batteries and check the expiry dates.**
 If the batteries do not have the same dates, contact your supplier.
- 6 Place the batteries in the battery unit with the terminal end down. Hold the batteries in place with the restraining bar.**

- 7 Locate the three white jumper wires and the red and black jumper cables supplied with the NTAK76 battery unit.
- 8 Connect the battery packs in series by connecting the white jumper wires between the + (red) terminal of one battery pack to the - (black) terminal of the next battery pack. (See Figure 70 on page 186).
- 9 Connect the remaining red and black jumper cable to red and black terminals of the first and fourth battery pack.
- 10 Connect the jumper cable to the NTAK76 breaker panel, marked J1. (See Figure 70 on page 186).

Note: The red positive (+) wire connects to the red (+) post of battery 1. The black negative (-) wire connects to the black post (-) of battery 4. Ensure all connections are secured.

Figure 70
Jumper connections

11 Set the breaker in the battery unit to ON to test for correct wiring.

The NTAK76 green LED (BATT) should switch on.

DC voltage can be measured between the test points whenever the green BATT LED is lit on the NTAK76. The test points are protected by high resistance: it is impossible to damage the battery unit by short-circuiting the test points to each other or to the metal case. For valid readings the test points must not be short circuited. The following different voltage readings can be made:

- open circuit battery voltage when the NTAK0420 cable is disconnected and the NTAK76 circuit breaker is closed
- NTDK78 DC output when the NTAK0420 cable is connected and the NTAK76 circuit breaker is open
- NTDK78 float charge voltage when the NTAK0420 cable is connected and the NTAK76 circuit breaker is closed

12 Set the breaker on the NTAK76 battery unit and the breaker on the NTDK78 power supply to OFF.**13 Plug the NTAK0420 cable from the battery box into the power supply in the cabinet. See Figure 71 on page 188.**

Secure the cable with the cable retainer inside the cabinet.

14 Set the breaker on the Option 11C power supply to ON.

The NTDK78 “BATT” LED should be off and the NTAK76 LED should be on.

15 Set the breaker on the NTAK76 battery unit to ON.

The NTAK04 or NTDK78 “BATT” LED should be lit and the NTAK76 LED should be on.

16 Replace the cover on the system cabinet and secure the latch.

————— *End of Procedure* —————

Figure 71
Power cord routing

Connecting other battery backup systems

This procedure describes how to install and connect customer-supplied battery backup systems.

Charging capabilities of the Option 11 C are described in the *Option 11C and 11C Mini Technical Reference Guide, NTP 553-3011-100*.

The system external ground must be installed before installing the battery backup.

Procedure 29

Installing other battery systems

- 1 Unpack the battery box and place it according to the equipment layout plan.**
- 2 Remove its cover.**
- 3 Set the switch on the battery box to OFF.**
- 4 Unpack the batteries and check the expiry dates.**

If the batteries do not have the same dates, contact your supplier.

WARNING

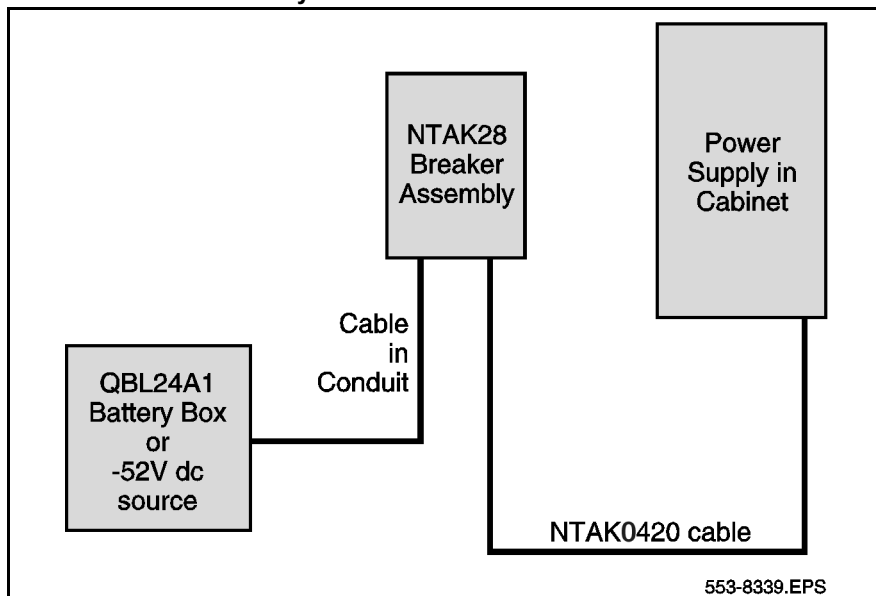

The battery cells can deliver high currents when short-circuited. Make sure that you do not inadvertently short-circuit the terminals of the batteries.

- 5 Place the batteries in the battery box.**
- 6 Locate the black wires supplied with the box.**
- 7 Connect the battery packs in series by installing the black wires between the + (large) terminal of one battery pack to the - (small) terminal of the next battery pack.**
- 8 Connect the black wire inside the battery box to the remaining positive (+) terminal and the red wire to the remaining negative (-) terminal.**

- 9 Mount the NTA28 Junction box securely to the wall within 900 mm (36 in.) of the cabinet it is serving. See Figure 72 on page 190.

Note: One NTA28 Junction box is required for each cabinet.

Figure 72
NTA28 breaker assembly location

- 10 Set the breakers on the NTA28 Junction box and on the NTDK78 power supply to OFF.
- 11 Connect the NTA0420 cable from the NTA28 junction box to the power supply in the cabinet.
Secure the cable with the cable retainer in the cabinet.
- 12 Connect the other end of the DC power cable to the connector on the NTA28 Junction Box.
- 13 Connect the cable from the battery box to the NTA28 Junction box as shown in Figure 73 on page 191.
- 14 Set the breakers on the NTA28 Junction box and on the NTDK78 ac/dc power supply to ON.

————— *End of Procedure* —————

Figure 73
NTAK28 circuit breaker assembly

Chapter 17 – Installing and connecting SDI and ethernet ports

General information

This Chapter contains modem setup requirements and two procedures for connecting communication devices to the Option 11C. The first explains how to install and connect SDI ports to terminals and modems. Instructions are provided on how to access ports through the NTDK20, NTDK23, NTDK25, NTDK80, NTAK02 and NTAK03 cards. The second procedure shows how to install and connect an ethernet cable to the Option 11C main cabinet.

Option 11C SDI ports are provided by the following cards:

- NTDK20 Small System Controller (SSC) card: provides three SDI ports
- NTDK23, NTDK25 and NTDK80 Fiber Receiver cards: each provides one SDI port
- NTAK02 SDI/DCH card: provides four ports of which up to two can be SDI ports
- NTAK03 TDS/DTR card: provides two SDI ports.

Note: The functionality of the NTAK03 card has been incorporated into the NTDK20 Small System Controller (SSC) card. The Option 11C, however, supports these cards in conjunction with the SSC card.

Modem setup requirements

Modems connected to Option 11C should be set as follows:

- CD (Carrier Detect): Active if carrier detected on incoming call
- CTS (Clear to Send): Normal operation or forced active
- Hardware and software: Disabled flow control.

The ports on Option 11C will be disabled if devices connected to them generate extra “garbage” characters. For this reason, modems should not be used in the following modes:

- Loopback
- Auto Echo
- Self Test.

Note: The SDI ports are designed for use with “dumb” modems. “Intelligent” modems may be used, however care must be taken to ensure that they do not enter into modes of operation that will send extra characters to the system.

Table 24 on page 194 lists some of the problems that may be encountered.

Table 24
Modem problems

Problem	Solution
CDR is not printing on an ESDI port configured as 8 bits, no parity, and 1 stop bit.	Change the modem set-up to 7 bits, no parity, 1 stop bit, or add MTC or SCH to the ESDI user prompt.
Modem is not communicating with the Option 11C when the User is MTC, BUG or CTY (The default setting of 8 bits, no parity, 1 stop bit is incompatible with the modem).	Change the modem set-up to 7 bits or the parity to EVEN/ODD.

Installing and connecting SDI ports

NTDK20 card

The baud rate for port 0 is controlled by a switch setting on the circuit card's faceplate. Ports 1 and 2 are user configurable in overlay 17.

- Port 0 is the only SDI port that can be used for software installation and upgrades.
- All three ports on the NTDK20 SSC card can be used to connect terminals or modems.
- An NTB48 3-port SDI cable must be used with the NTDK20 SSC card.

Note: The default baud rate of the SSC card is 1200 bps; the maximum data rate is 19,200 bps. When changing the DIP switch on the faceplate, make sure only one baud rate switch is set to ON (Refer to Table 25 on page 195).

Table 25
Default port configuration for the NTDK20 SSC card

Port	Use	Baud rate	Data bits	Stop bits	Parity
0	MTC/SCH/BUG	Set by a DIP switch	8	1	None
1	MTC/SCH/BUG	1200 (See Note 1)	8	1	None
2	MTC/SCHBUG	1200 (See Note 2)	8	1	None

Procedure 30 on page 196 describes how to connect a terminal, modems and other devices such as CDR devices and additional TTYs to the SSC card.

Procedure 30

Connecting SDI ports on the SSC card

- 1 **Connect the NTBK48 3-port SDI cable to the 9-pin SDI connection at the bottom of the main cabinet labelled connector “P2”.**

Figure 74
Cable connection

- 2 **Connect the system terminal to the cable marked “port 0” on the NTBK48 3-port cable.**

A Modem Eliminator Adapter is required to connect the Option 11C to a TTY terminal.

- 3 **If the system is to be accessed remotely, connect the system modem to the cable marked “port 1” on the NTBK48 cable.**
- 4 **Connect the modem to an outside line.**
- 5 **Test the modem for proper operation once the system is operating.**

Note: The remaining ports can be used for other equipment such as CDR devices or TTYs.

----- *End of Procedure* -----

NTDK23, NTDK25 and NTDK80 Fiber Receiver cards

The Fiber Receiver cards provide one SDI port per expansion cabinet.

The baud rate is set by a DIP switch on the card's faceplate. Other communication settings are identical to the port 0 configuration on the SSC card (Refer to Table 25 on page 195).

A Fiber Receiver card port must be configured using overlay 17 before it can be used to access overlays.

Note: Although all device numbers can be assigned to any cabinet, TTY 0, 1 and 2 are usually assigned to the main cabinet. TTY 3, 4, 5, and 6 are typically assigned to the first, second, third, and fourth expansion cabinets respectively.

Procedure 31 on page 197 describes how to connect the SDI ports on Fiber Receiver cards.

Procedure 31

Connecting SDI ports to the Fiber Receiver card

- 1 **Connect the NTA1118 one-port SDI cable to the 9-pin SDI connection at the bottom of the expansion cabinet labelled connector "P2". See Figure 75 on page 197.**

Figure 75
Cable connection

2 Connect the NTAK1118 SDI cable to a TTY terminal.

Note: A Modem Eliminator is required to connect to a terminal.

3 If the system is to be accessed remotely, connect the SDI cable to the system modem.

4 Connect the modem to an outside line.

5 Test the modem for proper operation once you have started up the Option 11C system.

————— *End of Procedure* —————

NTAK02 SDI/DCH card

The NTAK02 SDI/DCH card, which can only be used in the main cabinet, can be configured to support ports for the following:

- two SDI and two DCHI
- one SDI, one DCHI, two ESDI
- four ESDI.

NTAK02 ports can be used to access overlay software. These ports should be defined in the configuration database as the SDI logical type.

An NTAK19FB 4-port SDI cable is designed for use with the NTAK02 circuit card. However, an NE-A25B-type 25-pair cable can be used to extend the connections to the cross-connect terminal. See Table 26 on page 199 through Table 29 on page 202 for the connections for each port.

NTAK03 TDS/DTR card

The functionality of this card is incorporated into the design of the NTDK20 SSC card. Both cards, however, can exist simultaneously in a system.

An NTAK19EC cable is designed for use with the NTAK03 circuit card. However, an NE-A25B type 25-pair cable can be used to extend the connections to the cross-connect terminal. Table 30 on page 203 and Table 31 on page 204 show the connections for each port.

A modem eliminator is used to connect the RS232 converter cable and the NTAK19EC SDI cable to a terminal (not required when connecting to a modem).

Note: A modem eliminator is supplied with the system.

Table 30

Terminal setup

The terminal can be setup at any time, but it is not recommended that you do so during data transmission to avoid potential data loss.

Setup values are given in Table 33 on page 206, Table 34 on page 207 and Table 35 on page 208. Use the following procedure to set up the terminal.

Procedure 32

Setting up the terminal

- 1 Turn on the power for the terminal.
- 2 Enter setup mode by pressing the **<SETUP>** key located on the top row of the special function keys.

The current setup values are displayed.

- 3 Change the value in each field on each setup screen as necessary.

Use the following keys to view and change setup values:

Table 32
Setup (keys and functions)

Key	Function
Arrow key	Move from field to field
<Enter>	Scroll through possible values or cause requested action to take place (depends on type of field)
<Next Screen>	Move to next setup screen
<Prev Screen>	Move back to last screen

- 4 Save changes by returning to the **General setup** screen, moving the cursor to the **Saved** field, and pressing **<Enter>**.

————— *End of Procedure* —————

Installing and connecting an ethernet cable

Ethernet connection

The Option 11C system provides one 10 Mbps ethernet connection to a Local Area Network (LAN). The ethernet cable connector is located just left of the retaining bar in the main cabinet as shown in Figure 76 on page 209.

Figure 76
Ethernet port location

Note: An ethernet connection is not available on systems equipped with an NTDK26 Backwards Compatible Daughterboard on the NTDK20 SSC card (usually multi-cabinet systems interconnected with copper cable).

J7 Jumper plug

The J7 jumper plug must be in place on the NTDK20 SSC card for the ethernet function to operate. The jumper plug is present when the NTDK20 SSC card is shipped. However, it must be removed to accommodate the NTDK26 Backwards Compatible Daughterboard used in two-cabinet systems that are interconnected with a copper cable.

When a multi-cabinet system is upgraded from copper to fiber optic cable inter-cabinet connections, the NTDK26 Backwards Compatible Daughterboard must be replaced with fiber expansion daughterboards. The J7 jumper plug must be installed at the same time if the ethernet capability is required. See Figure 77 on page 210.

Figure 77
J7 Jumper Plug location on NTDK20 SSC card

Procedure 33**Connecting the Ethernet cable**

- 1** Insert the 50-pin end of the cable into the cable connector on the left side of the retaining bar as shown below.
- 2** Route the cable through the fifth cable groove from the left side.

The ethernet cable is a 50-pin amphenol to 15-pin AUI adaptor cable (Part number for ethernet cable NTDK27 A0630723). This provides a standard MAU attachment point.

Note: A jumper block located on connector J7 (near the Fiber 2 connector, see Figure 77 on page 210 and the following figure) on the component side of the NTDK20 SSC card must be in place for the ethernet connection to function. The NTDK20 SSC card is normally shipped with the plug installed. If the ethernet connection does not appear to function properly, check the jumper plug to make sure that it is installed.

Figure 78
Connector J7

- 3** If not previously done, configure the ethernet port in software as described in the *X11 Administration Input/Output Guide*.

————— *End of Procedure* —————

Chapter 18 – System start up and software installation

General information

This Chapter describes how to start up the Option 11C and make sure that it is operating properly. It also includes how to install software in a new system.

Before continuing with the procedures outlined in this Chapter, verify that all pertinent hardware is either connected to, or installed in the system.

WARNING

Make sure that the circuit breaker on the power supply in each cabinet is set to OFF before proceeding.

Boot Code compatibility

CAUTION

If installing an NTDK81 or NTTK13 Software Daughterboard, make sure that it is compatible with the Boot Code version on the SSC card. It must be NTDK34AA REL 09, or higher, or NTDK34FA. Read the information in “Chapter 12 – Installing the System Controller Card and Components” on page 131, under the heading “SSC card, Boot code and Software Daughterboard compatability” before proceeding.

Start-up procedures

There are two start-up procedures to choose from when starting up an Option 11C system. Use:

- Procedure 34 on page 214 to start-up a system with no system or configuration data stored in the system's Primary Flash drive.
- Procedure 35 on page 216 to start up a new Option 11C with system and configuration data already available in the Primary Flash drive.

Procedure 34

Start-up procedure for a newly programmed Daughterboard

1 Connect the external power supply, if not already done.

Note: If this system uses a commercial AC power supply, the power outlet should be tested to make sure that the correct voltage is present before plugging the power cord in the outlet.

If the system uses an external commercial AC power supply, plug the AC power cord from each cabinet into the commercial AC power supply outlet.

If the system uses a customer-provided DC power supply, plug the DC power cord from each cabinet into the DC power source.

2 For AC-powered systems, set the circuit breaker on the NTDK78 ac/dc power supply in each cabinet to ON.

For DC powered systems, set the circuit breaker on the NTAK28 circuit breaker assembly for each cabinet to ON. Set the circuit breaker on the NTDK72 DC power supply in each cabinet to ON.

Observe the LED on the faceplate of the NTDK20 Small System Controller (SSC) card. The LED should light steadily for a moment, then flash three times as it performs its self test.

3 Set the circuit breaker on the battery backup unit to ON (if the system has reserve power).

Note: A system equipped with the NTDK78 ac/dc power supply and a battery backup unit will continue to operate on DC reserve power if the AC supply fails. However, if the DC reserve power is interrupted, the NTDK78 cannot be powered up again until AC power is restored.

4 Observe the TTY or terminal screen.

Note: The TTY must be connected to TTY port 0.

After the system is loaded, a menu driven program called the “Software Installation Program” will be automatically invoked. Procedure 36 on page 217 provides complete detailed instructions to install the system software.

5 Observe the screen a second time once the installation program has been completed.

Messages will appear on the TTY or terminal screen. When the message “INIXXX” appears, the system is operational.

6 Perform an EDD using LD 43.

————— *End of Procedure* —————

Procedure 35
Start-up procedure for a previously installed programmed
Daughterboard

1 Connect the external power supply, if not already done.

Note: If this system uses a commercial AC power supply, the power outlet should be tested to make sure that the correct voltage is present before plugging the power cord in the outlet.

If the system uses an external commercial AC power supply, plug the AC power cord from each cabinet into the commercial AC power supply outlet.

If the system uses a customer-provided DC power supply, plug the DC power cord from each cabinet into the DC power source.

2 For AC-powered systems, set the circuit breaker on the NTDK78 ac/dc power supply in each cabinet to ON.

For DC powered systems, set the circuit breaker on the NTA28 circuit breaker assembly for each cabinet to ON. Set the circuit breaker on the NTDK72 DC power supply in each cabinet to ON.

Observe the LED on the faceplate of the NTDK20 Small System Controller (SSC) card. The LED should light steadily for a moment, then flash three times as it performs its self test.

3 Set the circuit breaker on the battery backup unit to ON (if the system has reserve power).

Note: A system equipped with the NTDK78 ac/dc power supply and a battery backup unit will continue to operate on DC reserve power if the AC supply fails. However, if the DC reserve power is interrupted, the NTDK78 cannot be powered up again until AC power is restored.

4 Observe the TTY or terminal screen.

Messages will appear on the TTY or the terminal screen. When the message "INIXXX" appears, the system is operational.

5 If required, set the system time and date using LD 2.

6 Perform an EDD using LD 43.

————— *End of Procedure* —————

How to install software in a new system

Summary of steps

The Software Installation steps are summarized in the following list:

- Install the Software Daughterboard and Security Device on SSC card.
- Install the SSC card in Main cabinet.
- Set the system time and date.
- Select the New System Installation menu
- Select Feature Set and packages
- Select a database
- Select Incremental Software Management (ISM) parameters
- Validate keycodes
- Load the software.

CAUTION

Wear the antistatic wrist strap provided in the bottom of the cabinet before handling circuit cards. Static electricity can damage the components of power supplies and circuit cards.

Procedure 36

Installing the software

- 1 If not previously done, install the Software Daughterboard and Security Device on the NTDK20 Small System Controller (SSC) card of the main cabinets.**

To install the Software Daughterboard and Security Device refer to Procedure 11 in “Chapter 12 – Installing the System Controller Card and Components” on page 131.

- 2 If not previously done, install the Fiber Daughterboards on the SSC card of the main cabinet.**

To install Fiber Daughterboards, refer to Procedure 12 in “Chapter 12 – Installing the System Controller Card and Components” on page 131.

3 If not previously done, install the NTDK20 Small System Controller (SSC) card in (slot 0) the main cabinet.

Note: The excess daughterboard cable should be placed in the Cable Routing Guide.

4 If not previously done, power up the system.

To power up the system:

- Make sure that the power is connected to the cabinet then set the circuit breaker on the front of the power supply unit to ON.
- the circuit breaker on the front of the power supply unit to ON.

5 Observe the initial system messages at the terminal screen:

- a** The following message appears if the Boot code on the SSC is compatible with the NTKK13 or NTDK81 software daughterboard:

Flash Boot: NTDK34FA

- b** If the version of the Flash Boot is not NTDK34FA, the following messages will appear:

No Program Store Flash installedProgram Store: 0 Mbytes

No Flash Drive installed

Flash Drive: 0 Mbytes

•
•

Flash Daughter board not installed. OS will not run.

- c** The forgo-ing messages indicate that the system cannot be started up. The Boot Code must be updated to REL 09 or higher. Refer to “SSC card, Boot code and Software Daughterboard compatability” on page 131 and *Option 11C and 11C Mini Upgrades Guide* for information about updating the Boot Code using the Flash Boot ROM utility.

6 Observe the terminal screen.

One of two messages will appear and the software installation proceeds accordingly. If the message is:

INSERT SOFTWARE DELIVERY CARD

Go to Step 7 on page 219.

OR IF the following is displayed:

SOFTWARE INSTALLATION PROGRAM

Go to Step 8 on page 219 .

7 Install the Software delivery card in the socket in the faceplate of the SSC card:

- a) Insert the card in slot A in the PCMCIA socket located in the faceplate of the NTDK20 SSC card. Refer to Figure 79 on page 220.
- b) Gently press on the Software Delivery card until it is firmly seated.

8 Observe the terminal screen.

If the following is displayed:

current system time and date: 00:00:00 -- 00/00/00

proceed to Step 9.

OR If the following is displayed:

Software Installation Main Menu

proceed to Step 10.

9 Set the system time and date, if prompted.

Note: The Time and Date prompt appears only when the Install Setup Program detects a system Year Date that is not in the range of 1995-2095. The responses shown below are examples of how to enter the system Time and Date:

Enter new time (hh/mm/ss)

08:00:00 <cr>

Enter new date (yy/mm/dd)

95/05/01 <cr>

08:00:00 -- 95/05/01 is the new system time and date

y <cr>

Figure 79

Enter selection: **1<cr>**

Note: Select option one through four depending on the type of installation you are performing.

11 Select the Feature Set to be enabled.

Note: The Feature Set selected must match the ones provided with key codes. The Feature Set names shown below are examples only.

Select Feature Set You Wish to Enable:

1. General Business (NTSKxxxx)
2. Enhanced Business (NTSKxxxx)
3. Enterprise (NTSKxxxx)
4. NAS/VNS (NTSKxxxx)

[q]uit, [p]revious, [m]ain menu, [h]elp or [?], <cr> redisplay

(example only:)

Enter Selection: **2** <cr> (Enhanced Business)

12 Indicate whether or not packages are to be added.

Feature Set Selection: Enhanced Business

Do you wish to add packages?

Select no, yes or abort:

n <cr> (no)

y <cr> (yes)

a <cr> (abort)

Note: Abort returns you to the main menu.

If the response was **NO** go to Step 15 on page 222.

If the response was **YES** go to Step 13 on page 221.

13 Select the Feature packages to be added.

Summary of Packages selected is:

0-2 4-5 7-14 16-25 28-29 32-64 67 70-77 79-83 86-93 95 98-104 107-111
113-116 118-120 122-125 127-129 131-133 135 137-141 167

Enter packages (s) to be added, blank line to end:

215-235 <cr>

Note: (<cr> ends selection entry or if no packages are to be added).

14 Confirm Feature Set and packages.

Your Feature Set Selection is “Enhanced Business”:

Additional Packages selected: 215-235

Summary of Packages selected is:

0-2 4-5 7-14 16-25 28-29 32-64 67 70-77 79-83 86-93 95 100-104 107-111
113-116 118-120 122-125 127-129 131-133 135 137-141 167

...

...

215-235

Is this selection correct?

n <cr> (no)

y <cr> (yes)

a <cr> (abort, return to main menu)

If the response was **NO** go to Step 11 on page 221.

If the response was **YES** go to Step 15 on page 222.

15 Select a Database.

If you are installing from a Software Delivery (PCMCIA) Card go to **Step 16 on page 223.**

IF you are installing from a Software Daughterboard continue here:

Select database to Install:

1. Pre-Configured database - Enhanced Business

2. Basic Configuration

3. CCBR Restore File

4. Option 11/11E Software Cartridge

[q]uit, [p]revious, [m]ain menu, [h]elp or [?], <cr> redisplay

Enter Selection: 1<cr>.

16 Select a Database using the PCMCIA card.

If you are installing from a Software Daughterboard go to Step 15 on page 222.

Select Database to Install:

1. Pre-Configured database
2. Basic Configuration (Release 22)
3. Archived database

[q]uit, [p]revious, [m]ain menu, [h]elp or [?], <cr> - redisplay

Example:

Enter Selection: 1 <cr>

Database Selection: Pre-Configured database

17 Confirm database selection.

Do you wish to continue?

n <cr> (no)

y <cr> (yes)

a <cr> (abort, return to main menu)

If the response was **NO** go to Step 15 on page 222.

If the response was **YES** go to Step 18 on page 223.

18 Review ISM parameters.

Note: On a new installation, the ISM parameters displayed on the terminal screen will be the default settings associated with the Feature Set selection. These settings can be accepted without changes or changed to suit the requirements of the new system.

Example: Current ISM Parameters:		Parameter Description
TNS	(32767)	maximum number of terminal numbers
ACDN	(32767)	maximum number of ACD DN's
AST	(32767)	(maximum number of associate Sets
LTID	(64)	maximum number of Logical Terminal IDs
RAN CON	(32767)	default RAN connection

RAN RTE	(32767)	default RAN routes
MUS CON	(32767)	default MUS connection)
BRAND	(0)	brandline
ACD AGENTS	(32767)	maximum number of ACD agents
ANALOGUE TELEPHONES (0)	maximum number of analogue sets
BRI DSL	(64)	maximum number of Digital Subscriber Loops
DIGITAL TELEPHONES (0)	maximum number Digital sets
WIRELESS TELEPHONES	(32767)	maximum number Wireless sets
TMDI D-CHANNELS	(0)	maximum number of channels
MOPT	(0)	Meridian Mail option

Do you wish to change ISM parameters?

n <cr> (no change)

y <cr> (change)

a <cr> (abort, return to main menu)

If the response was **YES** go to Step 19 on page 224.

If the response was **NO** go to Step 21 on page 226.

19 Select ISM parameters.

Do you wish to change any ISM parameters? (y/n/[a]bort) : y

Enter new ISM parameters, <cr> to leave unchanged :

TNS (32767) - <cr>

ACDN (32767) - <cr>

AST (32767) - <cr>

LTID (64) - <cr>

RAN CON (32767) - <cr>

RAN RTE (32767) - <cr>

MUS CON (32767) - <cr>

BRAND (0) - **1** <cr>

ACD AGENTS (32767) - <cr>

ANALOGUE TELEPHONES (0) - <cr>
BRI DSL (64) - <cr>
DIGITAL TELEPHONES (0) - <cr>
WIRELESS TELEPHONES (32767) - <cr>
TMDI D-CHANNELS (0) - <cr>
MOPT (0) - <cr>

20 Confirm ISM parameters.

New ISM parameters are:

TNS (32767)
ACDN (32767)
AST (32767)
LTID (64)
RAN CON (32767)
RAN RTE (32767)
MUS CON (32767)
BRAND (1)
ACD AGENTS (32767)
ANALOGUE TELEPHONES (0)
BRI DSL (64)
DIGITAL TELEPHONES (0)
WIRELESS TELEPHONES (32767)
TMDI D-CHANNELS (0)
MOPT (0)

Is this correct?

n <cr> (no)

y <cr> (yes)

a <cr> (abort, return to main menu)

If the response was **NO** go to Step 18 on page 223.

If the response was **YES** go to Step 21 on page 226.

21 Define the AUX ID.

Example:

Security ID: 20000445

Current AUX ID: 20000445

Do you wish to change the AUX ID?

y <cr> (yes)

n <cr> (no)

a <cr> (abort, return to main menu)

If the response was **NO** go to Step 23 on page 227.

If the response was **YES** go to Step 22 on page 226.

22 Enter the AUX ID.

Enter the Option 11C Security ID for the new AUX ID,

<cr> to maintain

12121212 <cr>

New AUX ID: 12121212

Is this correct?

y <cr> (yes)

n <cr> (no)

a <cr> (abort, return to main menu)

If the response was **NO** go to Step 21 on page 226.

If the response was **YES** go to Step 23 on page 227.

23 Review and confirm information entered.

New Installation Information Summary:

Security ID : 20000445

Aux ID : 12121212

Cabinet Type : MAIN

Feature Set : Lab only feature package (lab)

Additional Pkgs : none

Database : Pre-Configured database - Lab only feature package

OLD NEW

S/W Release : 2520F 2520F

ISM Parameters

TNS : 32767 32767

ACDN : 32767 32767

AST : 32767 32767

LTID : 64 64

RAN CON : 32767 32767

RAN RTE : 32767 32767

MUS CON : 32767 32767

BRAND : 0 0

ACD AGENTS : 32767 32767

ANALOGUE TELEPHONES : 0 0

BRI DSL : 64 64

DIGITAL TELEPHONES : 0 0

WIRELESS TELEPHONES : 32767 32767

TMDI D-CHANNELS : 0 0

MOPT : 0 0

Is this correct?

y <cr> (yes)

n <cr> (no)

a <cr> (abort, return to main menu)

If the response was **NO** go to Step 11 on page 221.

If the response was **YES** go to Step 24 on page 228.

24 Enter the keycodes

Enter new Keycodes:

Example:

Key 1:

Key 2:

Key 3:

xxxxxxx <cr>

yyyyyyy <cr>

zzzzzzz <cr>

‘Keycode validation successful’

WARNING A system restart will be invoked as part of the software

If the **successful** message appears go to Step 25 on page 229.

If the **unsuccessful** message appears, repeat this step, Step 24 on page 228.

After three unsuccessful keycode validation attempts, the following message appears:

Keycode validation unsuccessful.

Installation aborted...returning to main menu.

25 Complete the software installation.

Are you sure you wish to perform the installation?

y <cr> (yes)

n <cr> (no)

a <cr> (abort, return to main menu)

If the response was **NO** go o Step 10 on page 220.

If the response was **YES** this is the end of the software installation program. Continue with the next step, Step 5 on page 215.

————— *End of Procedure* —————

Chapter 19 – Connecting the telephones

General information

This chapter contains instructions for connecting telephones to the cross-connect terminal. It also contains the location of the individual extension numbers (DNs) when you are implementing one of the default numbering plans and how to activate each telephone.

Refer to the instructions provided with the telephone or console and to NTP 553-3001-215, *Telephone Sets and Attendant Consoles Installation Procedures*, for detailed information about installing telephones and consoles.

The cable from the cabinet card slot containing the line card associated with the telephone being connected, must be installed before you continue. Refer to **“Chapter 13 – Installing and connecting cross-connect terminals to cabinets” on page 147**, if additional cabling is required.

Cable assignments

The cables from each cabinet are labeled J1 through J10 at the cross-connect terminal. Each cable represents a specific set of Terminal Numbers (TNs) as shown in Table 36 on page 241.

WARNING

Always use caution when installing or modifying telephone lines. Avoid installing telephone wiring during a lightning storm. Do not install telephone jacks in wet locations unless the jack is specifically designed for wet locations. Never touch uninsulated telephone wiring unless the line has been disconnected at the network interface.

Cross-connecting telephones

Connect the telephones according to the following figures. Cross-connections for Analog (500/2500 type) telephones are shown in Figure 80 on page 233, and for Meridian Digital Telephones in Figure 81 on page 234.

Procedure 37

Cross-connecting telephones

- 1 **Locate telephone terminations at the cross-connect terminal.**
- 2 **Connect Z-type cross-connecting wire to the leads of the telephone.**
- 3 **Locate line circuit card (TN) terminations at the cross-connect terminal.**
- 4 **Connect the other end of the cross-connecting wire to the assigned TN terminal block.**

----- *End of Procedure* -----

Figure 80
NE-500/2500-type telephone cross-connections

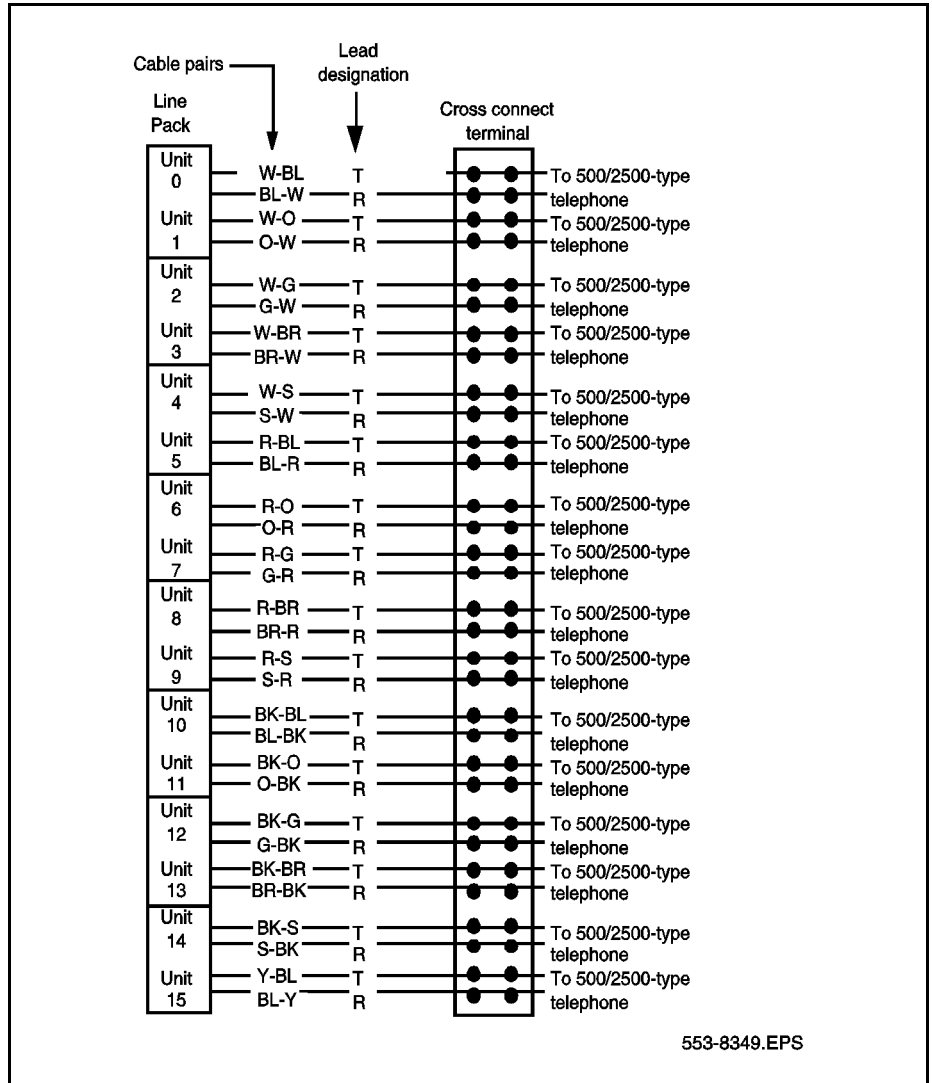

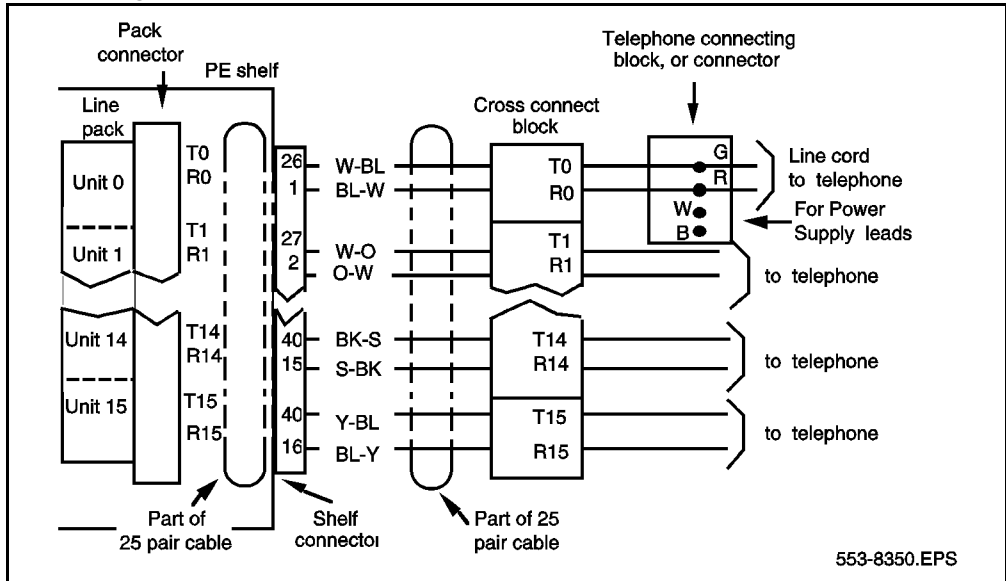

Figure 81
Meridian Digital Telephone cross-connections

Connecting telephones without a PFTU

Procedure 38

Connecting telephones without a PFTU

- 1 Locate the telephone terminations on the cross-connect terminal.
- 2 Connect one end of the cross-connect wire to the leads of the telephone.
- 3 Locate the line card terminations on the cross-connect terminal.

Refer to Table 36 on page 241.

4 Connect the other end of the cross-connect wire to the assigned TN terminal block.

Default DN assignments are given in the following Tables:

- Table 40, “Main Cabinet Default DN assignments,” on page 245
- Table 41, “Expansion Cabinet 1 Default DN assignments,” on page 246
- Table 42, “Expansion Cabinet 2 Default DN assignments,” on page 247
- Table 43, “Expansion Cabinet 3 Default DN assignments,” on page 248
- Table 44, “Expansion Cabinet 4 Default DN assignments,” on page 249

The telephone can now be activated as described on page 250.

Note: All the following tables show the **default** DNs.

————— *End of Procedure* —————

Connecting 500/2500-type telephones with a PFTU

Procedure 39

Connecting 500/2500-type telephones with a PFTU

- 1 Locate the telephone terminations on the cross-connect terminal.**
- 2 Connect one end of the cross-connect wire to the leads of the telephone.**
- 3 Locate the PFTU connections (unit PFT 1 through PFT 5) assigned to this telephone at the cross-connect terminal.**

Refer to Table 39 on page 244.

- 4 Connect the other end of the cross-connect wire to the pair assigned to the telephone on the PFTU.**
- 5 Connect a second cross-connect wire to the pair assigned to the line card on the PFTU.**

6 Locate the line card terminations on the cross-connect terminal.

Refer to Table 36 on page 241 for the Main cabinet and Expansion cabinets 1 and 2.

Refer to Table 37 on page 242 for Expansion cabinets 3 and 4.

7 Connect the other end of the cross-connect wire to the assigned TN terminal block.

Default DN assignments are given in the following Tables:

- Table 40, "Main Cabinet Default DN assignments," on page 245
- Table 41, "Expansion Cabinet 1 Default DN assignments," on page 246
- Table 42, "Expansion Cabinet 2 Default DN assignments," on page 247
- Table 43, "Expansion Cabinet 3 Default DN assignments," on page 248
- Table 44, "Expansion Cabinet 4 Default DN assignments," on page 249

The telephone can now be activated as described on page 250.

————— *End of Procedure* —————

Connecting off-premise telephones

Off-premise 500/2500-type telephones must be connected through an NTAK92AA Off-Premise Protection module. Each module can connect up to four analog telephones and can interface with an NT1R20 Off-Premise Station analog Line Card or with an NT8D09 Message Waiting Line Card.

WARNING

The message waiting line card produces -150 volts which is considered hazardous on off-premise telephones. Make sure that the -150 V is disabled on off-premise telephones.

The voltage is disabled when the Class Of Service (CLS) assigned to the telephone is LPD (message waiting lamp denied) and MWD (Message Waiting Denied) in LD 10.

Refer to the *X11 Software guides* for information about LD 10.

Under no circumstances shall LPA or MWA be assigned in the Class of Service on off-premise telephones.

Procedure 40

Connecting an off-premise telephone

- 1 Mount the NTAK92AA Off-Premise protection module on the wall using four #10 1/2 in (minimum) screws.**
- 2 Connect a #6 AWG (#40 Metric Wire Gauge) from the ground lug at the bottom of the NTAK92AA Off-Premise protection module to an earth ground. Refer to Figure 82 on page 239.**

WARNING

If connecting to a message waiting line card, unseat the card from its assigned slot before proceeding with the next step.

- 3 Connect two NTAK9204 cables (one from connector J1 and one from connector J2) from the protection module to the cross-connect terminal.**

Terminate the cables as shown in Figure 80 on page 233.

4 Cross-connect the J1 cable to the Tip and Ring connections coming from the line card.

Default DN assignments are given in the following Tables:

- Table 40, “Main Cabinet Default DN assignments,” on page 245
- Table 41, “Expansion Cabinet 1 Default DN assignments,” on page 246
- Table 42, “Expansion Cabinet 2 Default DN assignments,” on page 247
- Table 43, “Expansion Cabinet 3 Default DN assignments,” on page 248
- Table 44, “Expansion Cabinet 4 Default DN assignments,” on page 249

5 Cross-connect the J2 cable to the off-premise telephone.

6 Install the regulatory label provided with the Off-Premise protection module on the inside right-hand wall of the cabinet near the velcro wriststrap fastener.

7 Install the line card in its assigned position.

The telephone can now be activated as described on page 250.

————— *End of Procedure* —————

Connecting an attendant console

Procedure 41

Connecting attendant console

- 1 Locate the attendant console terminations at the cross-connect terminal.**
- 2 Locate the line card terminations at the cross-connect terminal.**
- 3 With cross-connect wire, connect the line card and other connections to the console as shown in Figure 83 on page 240.**

————— *End of Procedure* —————

Cross-connecting terminal Digital Subscriber Loops

Refer to 553-3011-311, *ISDN BRI Administration and Maintenance Guide*, for a complete description of terminal Digital Subscriber Loops (DSL) cross-connecting and installation.

Activating telephones

Activating telephones is straightforward. You activate each telephone by carrying out a procedure on the telephone itself. The software feature used to activate telephone sets is called “Automatic Set Configuration.”

Note: The data feature cannot be activated using the procedures in this chapter. If you want to program a telephone with the data feature, you must manually program it in LD 11 with Data class of service as described in the *X11 Software guides*.

Procedures for activating the following models of telephones are outlined:

- a default model with default extension number
- a customized model with a customized extension number.

These procedures are presented for telephones with and without character displays.

Telephone tones

There are a number of different telephone tones. The following table includes tones that you will hear during telephone activation:

Table 45
Telephone tones

Dial tone	A continuous tone.
Special dial tone	Three beeps followed by continuous dial tone.
Overflow tone	Like a busy tone, except faster and higher.
Relocation tone	A short high-pitched beep lasting for 4 seconds, followed by silence.

Note 1: Before activating a telephone, make sure that you have decided on its final location and are aware of the model number assigned to it and if it is to be customized.

Note 2: When activating Meridian Digital telephones, remember that they differ from the older Meridian Modular telephones. Meridian Modular telephones are allowed a combined total of 128 model telephones, whereas Meridian Digital telephones are allowed 128 models for each type of telephone. When you activate a Meridian Digital telephone, you must select the model associated with that telephone type or the telephone will not work.

Activating a default model with a character display

Procedure 42

Activating the telephone

- 1 Plug the telephone set into the jack and wait 20 seconds before picking up the handset. If you do not receive a dial tone, replace the handset and wait another 10 seconds before going off-hook again. Repeat this procedure until dial tone is received.**

If successful, the character display shows either “MODEL? X” (if the telephone relocation feature is **not** in use) or “RELOC OR MODEL? X” (if the telephone relocation feature **is** in use). “X” represents the default model for the telephone that you are activating.

Note: If you do not see the prompt “MODEL X” after lifting the handset, disconnect the telephone from the wall jack, wait five seconds, and re-insert the telephone into the jack. The telephone now shows “MODEL X” when you lift the handset.

Note: The 20 second time interval is required for the system to determine whether the set is new or if it is being relocated using the Modular Telephone Relocation feature.

- 2 Press the pound key (#) to select the default model.**

The character display shows “OK, EXTENSION? XXXX”. “XXXX” represents the default extension number for this telephone type.

3 Press the pound key again to select the default extension number.

You hear the relocation tone. The character display, shows “OK”.

OR

If the extension number is already in use by another telephone, you hear the special dial tone. If the telephone has a display it shows “MULTI-LINE, EXTENSION?”.

To accept the default extension number press the pound key.

To select a new extension number, manually enter an extension number and press the pound key.

OR

If the extension number is not available for use, the character display shows “ERROR, EXTENSION?” and you hear overflow tone.

This happens when you choose an extension number manually or when extension numbers are entered for additional keys. A default extension number will not be offered if it is not available.

Step 3 must be repeated and you must manually enter a new extension number.

Note 3: If other keys require secondary extension numbers, you are prompted until you enter all of the required extension numbers for the model.

Note 4: These extension numbers cannot be defaulted. The text display prompting for further extension numbers is “KEY kk EXT?” where “kk” represents the key number requiring the extension number.

Note 5: Each prompt for another extension number is accompanied by special dial tone. When you are programming an extension number, the lamp associated with that number on the telephone is lit.

4 Hang up the telephone receiver.

After approximately 10 seconds, the telephone is configured.

Note: If you replace the handset before completing the prompt sequence, the installation will automatically fail. This can be useful if you make an error and want to restart the procedure.

————— *End of Procedure* —————

Activating a default model without a character display

Procedure 43

Activating the telephone

- 1 **Plug the telephone set into the jack and wait 20 seconds before picking up the handset. If you do not receive dial tone, replace the handset and wait another 10 seconds before going off-hook again. Repeat this procedure until dial tone is received.**

Note: The 20 second time interval is required for the system to determine whether the set is new or if it is being relocated using the Modular Telephone Relocation feature.

- 2 **Press the pound key (#) to select the default model.**
- 3 **Press the pound key again to select the default extension number.**

You hear a short, high-pitched beep lasting four seconds followed by silence (relocation tone).

Note: If the extension number is already in use by another telephone, you hear three beeps followed by continuous dial tone (special dial tone).

To accept the default extension number press the pound key.

To select a new extension number, manually enter an extension number and press the pound key.

If the extension number is not available for use, you hear a fast, high-pitched broken tone (overflow tone). (This happens when you choose an extension number manually or when extension numbers are entered for additional keys. A default extension number will not be offered if it is not available). Step 3 must be repeated and you must manually enter a new extension number.

Note: If other keys require secondary extension numbers, you are prompted until you enter all of the required extension numbers for the model. These extension numbers cannot be defaulted. You are prompted for each additional extension number with three beeps followed by continuous dial tone (special dial tone). When you are programming an extension number, the lamp associated with that number on the telephone is lit.

————— *End of Procedure* —————

Activating a customized model with a character display

Table 46

Activating a customized telephone

- 1 Plug the telephone set into the jack and wait 20 seconds before picking up the handset. If you do not receive dial tone, replace the handset and wait another 10 seconds before going off-hook again. Repeat this procedure until dial tone is received.**

If successful, the character display shows either “MODEL? X” (if the telephone relocation feature is **not** in use) or “RELOC OR MODEL? X” (if the telephone relocation feature **is** in use). “X” represents the default model for the telephone that you are activating.

Note 1: If you do not see the prompt “MODEL X” after lifting the handset, disconnect the telephone from the wall jack, wait five seconds, and re-insert the telephone into the jack. The telephone now shows “MODEL X” when you lift the handset.

Note 2: The 20 second time interval is required for the system to determine whether the set is new or if it is being relocated using the Modular Telephone Relocation feature.

- 2 Press the digits associated with the customized model and press the pound key (#).**

Dial tone disappears after the first digit is pressed and you hear special dial tone after you press the pound key. If you enter a valid model number the character display reads “OK, EXTENSION?”. If you enter an invalid model, the previous prompt is reissued and you hear overflow tone.

3 Enter the customized extension number and press the pound key.

You hear relocation tone. The character display shows “OK”.

OR

If the extension number is already in use by another telephone, you hear special dial tone again. The character display shows “MULTI-LINE, EXTENSION?”.

OR

If the extension number is not available for use, you hear overflow tone. The character display shows “ERROR, EXTENSION?” and you must repeat this step.

Note: If other keys require secondary extension numbers, you are prompted until you enter all of the required extension numbers for the model. These extension numbers cannot be defaulted. The text display prompting for further extension numbers is “KEY kk EXT?” where “kk” represents the key number requiring the extension number. Each prompt for another extension number is accompanied by special dial tone. When you are programming an extension number, the lamp associated with that number on the telephone is lit.

4 Hang up the telephone handset.

After approximately 10 seconds, the telephone is configured.

Note: If you replace the handset before you complete the prompt sequence, the installation will automatically fail. This can be useful if you make an error and want to restart the procedure.

————— *End of Procedure* —————

Activating a customized model without a character display

Procedure 44

Activating a customized telephone

- 1 Plug the telephone set into the jack and wait 20 seconds before picking up the handset. If you do not receive dial tone, replace the handset and wait another 10 seconds before going off-hook again. Repeat this procedure until dial tone is received.**

Note: The 20 second time interval is required for the system to determine whether the set is new or if it is being relocated using the Modular Telephone Relocation feature.

- 2 Press the digits associated with the customized model and press the pound key (#).**

Dial tone disappears after the first digit is pressed, and you hear three beeps followed by continuous dial tone (special dial tone) after you press the pound key.

- 3 Enter the customized extension number and press the pound key.**

You hear a short high-pitched beep lasting four seconds, followed by silence (relocation tone).

If the extension number is already in use by another telephone, you hear special dial tone again.

If the extension number is not available for use, you hear a fast, high-pitched broken tone (overflow tone), and you must repeat this step.

- 4 Hang up the telephone handset.**

After approximately 10 seconds, the telephone is configured.

Note: If other keys require secondary extension numbers, you are prompted until you enter all of the required extension numbers for the model. These extension numbers cannot be defaulted. You are prompted for each additional extension number with three beeps followed by continuous dial tone (special dial tone). When you are programming an extension number, the lamp associated with that number on the telephone is lit.

————— *End of Procedure* —————

Activating terminals on a DSL

Refer to NTP 553-3011-311, *ISDN BRI Administration and Maintenance Guide*, for information about activating and initializing the various terminals that can be connected to a terminal DSL.

Chapter 20 – Connecting the trunks

General information

This Chapter describes how to connect trunks directly to the trunk card, with or without the use of a Power Fail Transfer Unit (PFTU).

Note: The QUA6 Power Fail Transfer Unit operates with loop-start and ground-start CO trunks. However, with ground-start trunks the associated telephone set must be equipped with a ground-start button.

On the Option 11C, during the initial software installation, the installer has the option of loading a default database containing pre-programmed trunk data into software. If necessary, the default data can be modified at any time to meet the specific needs of a customer. For a complete description of how to modify pre-programmed trunking data, refer to “Chapter 23 – Changing pre-programmed data” on page 345 in this Guide.

WARNING

Always use caution when installing or modifying telephone lines. Avoid installing telephone wiring during a lightning storm. Do not install telephone jacks in wet locations unless the jack is specifically designed for wet locations. Never touch uninsulated telephone wiring unless the line has been disconnected at the network interface.

Connecting trunks without PFTU

Procedure 45

Connecting trunks without PFTU

- 1 From the assignment record, determine the location of the trunk connection and its associated Terminal Number (TN) at the cross-connect terminal.
- 2 With cross-connecting wire, connect the trunk to the TN.

Make sure that the wiring is not reversed and is on the proper terminals.

The connections for trunks are listed in Table 48 on page 262, Table 49 on page 263 and Table 50 on page 264.

————— *End of Procedure* —————

Connecting trunks with PFTU

Procedure 46

Connecting trunks with PFTU

- 1 Locate the PFTU terminal blocks at the cross-connect terminal.
- 2 Cross-connect the first pair of the assigned PFT to the telephone.
Refer to Table 47 on page 261 for PFTU connections.
- 3 Cross-connect the second pair of the PFT to the TN assigned to the telephone.
- 4 Cross-connect the third pair of the PFT to the central office trunk.
- 5 Cross-connect the third pair of the PFT to the TN assigned to the trunk.
- 6 Repeat for each trunk assigned to the PFTU.

————— *End of Procedure* —————

Trunk Connections

NT8D14 Universal trunk card

The universal trunk card provides eight analog trunks which can function in the modes shown in Table 48 on page 262.

Table 48
NT8D14 Universal trunk — modes and option settings

Modes	Location	Jumper strap
Central (CO)	J1, J2	OFF
2- way tie trunk (loop Dial Repeat)	J1, J2	OFF
2 - way tie trunk (Outgoing Incoming Dial)	J1, J2	OFF
Recorded Announcement (RAN)	J1, J2	OFF
Paging trunk	J1, J2	OFF
Japan CO/DID operation	J1, J2	OFF
DID operation Loop length > 2000 %	J1, J2	ON
DID operation Loop length < 2000 %	J1, J2	OFF
Note: OFF indicates no strap present. J1 and J2 locations apply to all eight trunks.		

Refer to Table 49 on page 263 for the connections to the NT8D14 universal trunk at the cross-connect terminal.

Activating a default model trunk

Due to the automatic thirty second time-out on the administration menu, be sure that you have prepared the data that you want to input before you begin. To determine corresponding TNs and trunks, check the location of trunk cards in the cabinet or use LD 32.

INSTRUCTIONS FOR THE UK

Refer to the *Meridian 1 Guide for the UK (553-3001-110)* for a list of the default trunk models and trunk routes used in the UK.

Procedure 47

Activating a default model trunk

- 1 Pick up the handset of the administration telephone.**
- 2 Enter the Option 11 administration Flexible Feature Code to access the administration menu.**
The prompt “PASSWORD?” appears.
- 3 Enter the default administration telephone password.**
You hear special dial tone and the prompt “TASK?” appears in the top line of the character display.
The second line of the display reads “1 ADD TRUNK”.
- 4 Select “1 ADD TRUNK” by entering the number “1”.**
The prompt “ROUTE ACCESS?” appears on the character display.

5 Enter the access code of the route to which you want to add a trunk and press the pound key (#).

The prompt

“TN?”

asks you to enter a TN (Terminal Number) from one of the installed trunk cards.

If you do not enter a valid route number, “TN?” does not appear and the screen remains the same. If the type of trunk card does not match the route, the prompt “ROUTE ACCESS?” appears again, and you hear overflow tone.

6 Enter the TN in Option 11 format (CCUU) and press the pound key.

The prompt

“MODEL”

appears. If you enter an invalid TN, the display shows “INVALID, TN?” and you must enter a new TN using the Option 11 format.

7 Press the digits to select a trunk model (as assigned in LD 16).

The character display shows

“OK”.

After a delay of approximately 4 seconds you hear special dial tone.

The sequence is repeated when the prompt

“TN?”

appears on the character display.

The next valid trunk TN is automatically incremented after each trunk is activated.

8 Terminate the sequence by hanging up the telephone receiver.

OR

Repeat the sequence by going through the steps again.

By entering “#” when the procedure repeats, you accept the next TN and are prompted for the model type.

By entering “#” again, you accept the previously accepted model.

Note: The model chosen during the first trunk activation sequence will be the default model for all subsequent trunks until you hang up the telephone or manually enter a new trunk model number.

————— *End of Procedure* —————

Activating a selected model trunk

Due to the automatic thirty second time-out on the administration menu, be sure that you have prepared the data that you want to input before you begin. To determine corresponding TNs and trunks, check the location of trunk cards in the cabinet or use LD 32.

Procedure 48

Activating a selected model trunk

- 1 Pick up the handset of the administration telephone.**
- 2 Enter the administration Flexible Feature Code to access the administration menu.**
- 3 Enter the default administration telephone password.**

You hear special dial tone and the prompt “TASK?” appears on the top line of the character display. The second line of the character display reads “1 ADD TRUNK”.
- 4 Select “1 ADD TRUNK” by entering the number “1”.**

The prompt
“ROUTE ACCESS?”
appears.
- 5 Enter the access code of the configured trunk route to which you want to add the trunk and press the pound key (#).**

The prompt
“TN?”
asks you to enter a TN from one of the installed trunk cards. If you do not enter a valid route number, “TN?” does not appear and the screen remains the same. If the card does not match the route, the prompt “ROUTE ACCESS?” appears again, and you hear overflow tone.
- 6 Enter the TN in Option 11 format (CCUU).**

The response
“MODEL?”
prompts you to select a model number for the trunk.

7 Enter a trunk model number for the specified TN and route and press the pound key.

The character display shows:

“OK”

After a delay of approximately 4 seconds you hear special dial tone and the sequence is repeated when the following prompt appears on the character display.

“TN?”

8 Hang up or repeat the sequence.

The sequence ends when the last unit in the card is used and the program is complete, or when you hang up the telephone receiver.

Note: The model used for the first trunk activated in the sequence will be the default for all subsequent trunks until the telephone is hung up unless you manually enter a new trunk model number.

————— *End of Procedure* —————

Chapter 21 – Connecting an external alarm

General information

There are two methods of connecting an external alarm to the system:

- through an alarm port assigned in software
- through contacts in a QUA6 Power Fail Transfer Unit (PFTU).

Alarm port assigned in software

The system can be equipped with an alarm port using an analog line connected to an Analog (2500/500)-type telephone or other similar type of ringing or alerting device.

The alarm will operate when a BSD090 message indicates a power fault in the system. Information about BSD090 messages is contained in the *X11 Software Guides*.

Procedure 49

Installing an alarm using an alarm port

- 1** **Install an analog (500/2500)-type line as described in “Chapter 19 – Connecting the telephones” on page 231.**
- 2** **Install an analog (500/2500)-type telephone or other similar alerting device used as an alarm to the line.**

The set can be typically assigned as a Model 20.

- 3 Use LD 15 and make the following changes. Only the prompts requiring a response are listed. Press *return* in response to the other prompts.**
- Enter CHG in response to the prompt REQ
 - Enter CDB in response to the prompt TYPE
 - Enter the customer number (0-99) in response to the prompt CUST
 - Enter the DN of the line assigned as an alarm port in response to the prompt ALDN.

Note: If the assigned DN is inadvertently called the alarm will activate. To avoid false alarms, make sure that the DN is not consistent with the assigned numbering.

- Press *return* in response to the remaining prompts.

————— *End of Procedure* —————

Alarm through a QUA6 PFTU

A QUA6 PFTU can be used to connect an external alarm through normally open or normally closed contacts of one of its units. The contacts will operate under the same conditions as the PFTU itself, and can support the following capacities:

Table 67
AC and DC capacities

	AC	DC
Maximum switching power	50.0 V A.	30.0 W
Maximum switching voltage	125.0 V rms	150.0 V
Maximum switching current	0.5 A	0.5 A

Figure 85 on page 287 shows an example of the contacts on one unit (PFT1) of the PFTU. The contacts are show in normal operating mode, not in failure mode. Table 68 on page 288 gives the connections for all units on the PFTU.

Chapter 22 – Pre-programmed data

General information

When an Option 11C system is initially installed, customer data must be entered into the overlay programs. Telephones, for example, must be assigned features on their keys to allow them to function properly.

However, the Software Daughterboard can be pre-programmed with the customer data. If you load pre-programmed data into the system during the Installation process, some overlay entries will be automatically configured on the telephones. For example, you can choose a telephone model that has predetermined feature and key assignments and a preassigned class of service. This can be a significant time-saver if you have to program numerous types of telephone models.

Pre-programmed data is not mandatory for software installation. In fact, the Software Daughterboard can be programmed with the minimum number of files to allow the Option 11C to operate.

This chapter contains information on the following:

- Passwords and codes
- the Default numbering plan
- Flexible Feature Codes
- SDI ports
- Trunk routes and models
- and Model telephones.

Passwords and codes

The following table shows each function in the left column and a corresponding password or code on the right.

Table 70
Passwords and codes

Function	Code or extension(s)
TTY password (For access to TTY Option 11C overlays)	0000
Meridian Mail administration password	adminpwd
Administration telephone password	1234
Administration telephone FFC	*41
SPRE code	1
Telephone relocation Flexible Feature Code	*40
Telephone Removal Flexible Feature Code	*42
Telephone relocation password (SCRD)	1234

Default numbering plan

The default numbering plan for Option 11C is based on the following guidelines:

- The default numbering plan uses four digits and starts at 2200.
- The prime extension number (DN) for each telephone is in the range 2200-2XXX. The value of “XXX” varies depending on the number of telephones that you have in the system. Any secondary extension numbers use numbers outside this range. This arrangement allows Option 11 and Meridian Mail to automatically configure telephones and corresponding mailboxes without manual intervention.
- Meridian Mail uses extension 7000 for access, 7001 for Auto Attendant, 7002 for Express Messaging, and 7003 for Prompt Maintenance.
- Meridian Mail Virtual Agents are pre-configured for Card 10 in Unit 0, 1, 2, 8, 9, and 10 of the main cabinet.
- The Central Answering Position has an extension of 7700. This extension can be changed in LD 15.

First digits

The following table shows the default numbering plan for Option 11C:

Table 71
Default numbering plan—First digit

First digit	Pre-programmed use for digit
1	SPRE code
2	Not used
3	Not used
4	Not used
5	Not used
6	Not used
7	COT/TIE/DID/WATS/FEX/RAN/MUS/AWR/Paging Trunk access codes, Meridian Mail queues and attendant DN, Call park DNs
8	Not used
9	Not used
0	Attendant extension

Note: The first number of the default numbering plan is pre-programmed as 2200. The remaining numbers in the default numbering plan are designated in software, but do not become active until they are selected during the telephone activation procedure.

The digit “7” in the default numbering plan is programmed with many system features to assist you in configuring the Option 11C system. If you have the Meridian Mail card option software, it automatically configures user mail boxes to correspond with the 2200 numbering plan. In addition, the pre-programmed Meridian Mail queues in the Meridian Mail software match the default data on the Option 11C system.

Important extension numbers

Table 72
Default numbering plan—important extension numbers

Extension	Use
Attendant extension	0
First number in numbering plan	2200
Night number	7700*
Queue for Central Answering Position	7700 *
General ACD queue	7750 *
Meridian Mail miscellaneous ACD queues:	7000-7009
Meridian Mail extension	7000
Auto attendant extension	7001
Express messaging	7002
Prompt maintenance	7003
Miscellaneous queues	7004-7009
Meridian Mail position I.D.	7800-7811
Meridian Mail agent extensions	7830-7841
Call park extensions	7900-7919

* The thresholds which control the agent AWC keys have been set as follows:

CWTH 1
 CWLF 2
 CWLW 4.

Extensions assigned to card slots**Table 73**

9	2968 through 2983
10	2984 through 2999

Flexible Feature Codes

Flexible Feature Code (FFC) data is used in many administrative procedures. The table below lists the FFCs for the Option 11C system.

Table 78
Flexible Feature Codes

FFC Prompt	FFC	Definition
ASRC	*40	Automatic Set Relocation
AREM	*42	Automatic Set Removal Code
ADMN	*41	Administration Set Access Code
CFWA	#1	Call Forward All Calls Activate
CFWD	#1	Call Forward All Calls Deactivate
C6DS	*70	6 Party Conference Code
HOLD	#4	Permanent Call Hold
MNTC	*43	Maintenance Access Code
PUGR	*71	Pick-up Group Code
RDLN	*72	Last Number Re-dial
RDST	*73	Store Last Number Re-dial
RGAA	*74	Ring Again Activate
RGAD	*75	Ring Again Deactivate
RGAV	*77	Ring Again Verify
SPCC	#2/*80	Speed Call Controller Code
SPCU	#3/*81	Speed Call User Code
SSPU	*89	System Speed Call User Code

SDI ports

The minimum system port configuration for Option 11C is 3 SDI ports, all of which can be found on the NTDK20 System Controller card.

You can obtain additional ports by installing an NTAK02 SDI/DCH circuit card. The SDI/DCH card has 4 serial I/O ports with three possible configurations:

- 2 asynchronous ESDI ports with 2 DCHI ports
- 2 synchronous ESDI ports, or
- 2 SDI ports.

The default SDI port configuration is shown below. The value for “XX” is set on the faceplate of the CPU/CONF circuit card.

Table 79
Pre-configured SDI ports

TTY Number	Card	Port	Use	Configuration
0	0	0	MTC/SCH/BUG	XX/8/1/NONE
1	0	0	MTC/SCH/BUG	1200/8/1/NONE
2	0	1	MTC/SCH/BUG	1200/8/1/NONE
8	10	0	LSL	1200/8/1/NONE
9	10	1	CMS	4800

Modem port

The pre-configured modem port allows the remote maintenance modem to be connected with further system programming. This port is pre-configured as TTY 0 (port 0 on the System Controller card) and is programmed for Maintenance (MTC), Service Change (SCH) and BUG messages.

Enhanced Serial Data Interface (ESDI) port

Port 9 is pre-programmed as an ESDI port and supports Meridian Mail. It functions as a Command Status Link with the following settings:

ESDI settings

Table 80
ESDI settings

Setting	Code
BPS	4800
CLOK	EXT
IADR	003
RADR	001
T1	10
T2	002

N1	128
N2	08
K	7
RXMT	05
CRC	10
ORUR	005
ABOR	005
USER	CMS
ENL	NO

Telephone tones

The telephone tones in North America are as follows:

- **Dial tone** A continuous tone.
- **Special dial tone** Three beeps followed by continuous dial tone.
- **Overflow tone** Like a busy tone, except faster and higher.
- **Relocation tone** A short high-pitched beep lasting for 4 seconds, followed by silence.

Trunk routes

The following table shows pre-programmed trunk route information that you need on hand to activate and modify trunks.

Table 81
Pre-programmed trunk route information

Route	Type	Access Code	Mode	Interface
00 *	COT	7100	IAO	-
01 *	COT	7101	ICT	-
02 *	COT	7102	OGT	-
03	TIE	7103	IAO	-
04	TIE	7104	ICT	-
05	TIE	7105	OGT	-
06	DID	7106	ICT	-
07	WAT	7107	IAO	-
08	WAT	7108	ICT	-
09	WAT	7109	OGT	-
40	MUS	7140	OGT	-

* These trunks are set for Wink start.

Model telephones

This section contains a series of tables listing the different telephones, their intended use, assigned class of service options, and key number positions with assigned features.

With the exception of the administration and CAP model telephones, the models are organized according to software packages.

Note: OPS telephones do not have their own telephone models. You can, however, create OPS models in by entering DD in response to the CDEN prompt in LD 10.

Administration telephones

- M2008 - one model
- M2616 - one model

CAP telephones

- M2616 - one model
- M2216 - one model

General Business telephones

- M2000 telephones
 - M2317 - two models
 - M2009 - two models
 - M2112 - two models
 - M3006 - two models
 - M2018 - two models
- Analog (500/2500 type) telephones - seven models
- M2006 - five models
- M2008 - fifteen models
- M2616 - twelve models
- M2216 - two models.

Hotel and Motel telephones

- 500- and 2500-type telephones - one model
- M2006 - two models
- M2008 - two models
- M2616 - one model

Health Care telephones

- M2006 - one model
- M2008 - four models
- M2616 - two models.

This section provides model numbers for each telephone type and tables showing the numbering and placement of the keys and the feature assigned to each key.

Acronyms for Class of Service options are shown in the following tables for each model telephone in this section.

Table 85
Class of service options - analog telephones

Prompt	Meaning
TLD	Toll Denied
HTA	Hunting Allowed
LNA	Last Number Redial Allowed
FNA	Call Forward No Answer Allowed
PUA	Pickup Allowed
XRA	Ring Again Allowed
MWA	Message Waiting Allowed

Table 86

FND	Call Forward No Answer Allowed
PUD	Pickup Denied
MWA	Message Waiting Allowed

Administration telephones

M2008 model 99

Intended use: Administration (maintenance) telephone

Assigned Class of Service options:

MTA/ADD/LNA/FNA/GPUA/MWA/FBD

Key number position	Feature
7	Blank
6	Message
5	Transfer
4	Speed Call (personnel: 99)
3	Forward
2	Conference
1	DN
0	DN

M2616 model 99

Intended use: Administration (maintenance) telephone

Assigned Class of Service options:

MTA/LNA/FNA/GPUA/MWA/ADD//HFA/FBD

Feature	Key number position	Key number position	Feature
-	15	7	-
Auto Dial	14	6	Message
Auto Dial	13	5	Transfer
Auto Dial	12	4	Ring Again
Auto Dial	11	3	Forward
Auto Dial	10	2	Conference
Auto Dial	9	1	DN
Speed Call (personnel: 99)	8	0	DN

Central Answering Position (CAP) model telephones

M2616 and 2216 CAP telephone model 60

Intended use: Central Answering Position telephone

Assigned Class of Service options:

LNA/FND/GPUA/MWA/ADD/HFD/AGN/FBD/SPV

Feature	Key number position	Key number position	Feature
Hot *	15	7	-
Make Set Busy	14	6	DN
Display Waiting Calls	13	5	Park
Auto Dial	12	4	Override
Auto Dial	11	3	Add
Auto Dial	10	2	Consult/Join
Auto Dial	9	1	Extend
Auto Dial	8	0	ACD Queue (7700)

* This key is used as a Hotline to connect to the office paging system. Assign it with the paging route access code and define it when you activate the telephone.

Note: With the M2616 CAP you must use an ACD character display. In the system software, the Extend key is actually called a Transfer key, the Consult/Join key is called a Conference key, and the Add key is called a No Hold Conference key.

General business models

M2000 series telephones

The M2000 series telephones - M2112, M2018, M2317, M2009, and M3000 - are limited to a **combined total** of 128 model telephones. (In other words, there can be no more than a combined total of 128 different models for all the M2000 series telephones.)

It is up to you to make sure that the model associated with the telephone you are activating is pre-defined. You must select the model associated with the telephone or the telephone will not work.

M2317 model 20

Intended use: Two-line general business telephone with display

500- and 2500-type telephones

Note: When you are activating a 500-type telephone, you must use a 2500-type telephone to define the features. Once you have done this, unplug the 2500-type telephone and replace it with the 500-type telephone that you are activating.

500- and 2500-type telephones model 20

Type of telephone: Support staff telephone with toll denied

Intended use: Business telephone

Assigned Class of Service options:

TLD/C6A/CFXD/DTN/FND/GPUA/LNA/XFA/XRA/FBD

500- and 2500-type telephones model 21

Type of telephone: Support staff telephone

Intended use: Business telephone

Assigned Class of Service options:

UNR/C6A/CFXD/DTN/FND/GPUA/LNA/XFA/XRA/FBD

500- and 2500-type telephones model 22

Type of telephone: Support staff telephone with message indication lamp

Intended use: Business telephone

Assigned Class of Service options:

MWA/TLD/C6A/CFXD/DTN/FNA/GPUA/LNA/XFA/XRA/FBD/LPA

500- and 2500-type telephones model 23

Type of telephone: Support staff telephone with message indication lamp

Intended use: Business telephone

Assigned Class of Service options:

MWA/UNR/C6A/CFXD/DTN/FNA/GPUA/LNA/XFA/XRA/FBD/LPA

500- and 2500-type telephones model 24

Type of telephone: Support staff telephone with message indication and no lamp

Intended use: Business telephone

Assigned Class of Service options:

MWA/TLD/C6A/CFXD/DTN/FNA/GPUA/LNA/XFA/XRA/FBD/LPD

500- and 2500-type telephones model 25

Type of telephone: Support staff with message indication and no lamp

Intended use: Business telephone

Assigned Class of Service options:

MWA/UNR/C6A/CFXD/DTN/FNA/GPUA/LNA/XFA/XRA/FBD/LPD

500- and 2500-type telephones model 26

Type of telephone: Courtesy telephone

Intended use: House telephone

Assigned Class of Service options: MNL/TLD

Hotel and Motel telephone models

500- and 2500-type telephones

Note: When you are activating a 500-type telephone, you must use a 2500-type telephone to define the features. Once you have done this, unplug the 2500-type telephone and replace it with the 500-type telephone that you are activating.

500- and 2500-type telephone model 40

Type of telephone: Guest room telephone

Intended use: Guest calls

Assigned Class of Service options: CCSA/MWA/DTN

Health care telephone models

500- and 2500-type telephones

Note: When you are activating a 500-type telephone, you must use a 2500-type telephone to define the features. Once you have done this, unplug the 2500-type telephone and replace it with the 500-type telephone that you are activating.

500- and 2500-type telephone model 50

Type of telephone: Nurses station telephone with speed call

Intended use: Health care telephone

Assigned Class of Service options: FND/LNA/GPUA/MWA/FBD

500- and 2500-type telephone model 51

Type of telephone: Nurses station telephone with message and speed call

Intended use: Health care telephone

Assigned Class of Service options: FNA/LNA/GPUA/MWA/NDD/FBD

500- and 2500-type telephone model 52

Type of telephone: Nurses station telephone with speed call and display

Intended use: Health care telephone

Assigned Class of Service options: FND/LNA/GPUA/MWA/ADD/FBD

500- and 2500-type telephone model 53

Type of telephone: Nurses station set with message, speed call and display

Intended use: Health care telephone

Assigned Class of Service options: FNA/LNA/GPUA/MWA/ADD/FBD

Chapter 23 – Changing pre-programmed data

General information

The pre-programmed data on the Option 11C system can provide an effective starting point for programming the system's telephone and trunking information.

This chapter shows how to change the default Option 11C numbering plan. You may want to change the numbering plan for one or more of the following reasons:

- to change the first number in the numbering plan
- to shift the start of the numbering plan to another card slot
- the default numbering plan interferes with the system data.

In addition to making changes to the default numbering plan, this section provides information about modifying model telephone and trunk programming stored in the Option 11C pre-programmed data.

Changing the default numbering plan

Extensions assigned differ from the default numbering plan

Compare the first digits assigned to this system with the default numbering plan as shown in the “Default numbering plan” on page 292.

- If the first digit is in the unused range, change the first number in the default numbering plan. To do this, follow the instructions in the section of this Chapter called “Changing the first number in the numbering plan” on page 346.
- If the first digit is being used by Meridian Mail, trunk routes, or other data, you must remove these interferences. Follow the instructions found later in this chapter in the section called “Removing numbering plan interferences” on page 350.

Changing the first number in the numbering plan

To change the first number in the numbering plan perform the following procedure:

Procedure 50

Changing the first number in the numbering plan

- 1 Pick up the handset of the administration telephone.**
- 2 Enter the administration Flexible Feature Code. (For some countries, this value is listed in the “Flexible Feature Codes” on page 298.)**
- 3 Enter the administration telephone password. (For some countries, this value is listed in the, “Passwords and codes” on page 292.)**
- 4 You hear special dial tone and the prompt “TASK?” appears on the top line of the character display.**
- 5 Press the asterisk (*) three times.**

The second line of the character display reads “4 INSTALLATION OPTIONS”.

6 Select “4 INSTALLATION OPTIONS” by entering the number “4”.

The character display reads:

1 DEFAULT SETS

2 NUMBERING PLAN

7 Select “2 NUMBERING PLAN” by entering the number “2”.

The character display reads:

FIRST NUMBER (XXXX)?

8 To create a new first number, enter the digits you want and press the pound key.

The number you enter as the first number in the numbering plan is assigned to slot number one, unit zero of the main cabinet. The default numbers assigned to the remaining card and unit combinations are consecutive in the Option 11C system assuming that each slot consists of up to 16 units.

————— *End of Procedure* —————

Determining new extension numbers

If you wish to change the default numbering plan, and need to determine the extension number that will be assigned to a specific telephone, perform the following procedure:

Procedure 51**Determine the extension number**

- 1 Identify the line card to which the telephone is connected. Take the card slot number associated with the card and subtract 1.**
- 2 Multiply this number by 16.**
- 3 Add the first extension number in the new numbering plan.**
- 4 Identify the unit number the telephone is terminated on and add it to the result obtained in step 3.**

————— *End of Procedure* —————

Example:

Assume the new numbering plan starts at extension number 4500. You wish to know the extension number of the telephone connected to card 8, unit 12:

- 1 Subtract 1 from the card slot number (8-1): $= 7$
- 2 Multiply by 16: $\begin{array}{r} \times 16 \\ = 112 \end{array}$

- 3 Add the first extension number: +4500

- 4 Add the unit number: + 12
Number assigned to card 8, unit 12 4624

Note: If you are using a three digit numbering plan, follow the same procedure.

Example:

The new three digit numbering plan starts at extension number 300, and you wish to know the extension number of the telephone connected to card 8 unit 12:

- 1 Subtract 1 from the card slot number (8-1): $= 7$
- 2 Multiply by 16: $\begin{array}{r} \times 16 \\ = 112 \end{array}$

- 3 Add the first extension number: $+ 300$

- 4 Add the unit number: $+ \underline{12}$
Number assigned to card 8, unit 12 424

If you want the system to have a consecutive numbering plan, make sure that the line cards are in consecutive card slots in the Option 11 cabinet.

If the line cards are arranged consecutively, the pre-assigned telephone extensions are automatically configured during telephone activation, and you do not have to manually enter them.

Using the Meridian Mail auto-configure feature

The Meridian Mail auto-configure feature automatically matches up Meridian Mail mail boxes with telephone extensions. If you have the Meridian Mail card option and you want to use the Meridian Mail auto-configure feature, make sure of the following:

- The numbering plan is consecutive
- The first number in the Option 11 system and the Meridian Mail system are the same.

Shifting the numbering plan to a new card slot

The first number in the numbering plan is assigned to slot 1, unit 0. You may wish to shift the first number in the numbering plan to a different card slot, since the TDS/DTR card is pre-programmed for slot 1.

The following procedure describes how to shift the first number in the numbering plan to a specific card slot.

Procedure 52

Shift the first number in the numbering plan to a different card slot

- 1** **Locate the first line card. Subtract 1 from the card slot number it is housed in.**
- 2** **Multiply this number by 16.**
- 3** **Take the first number in the numbering plan and subtract the value obtained in step 2.**

Note: When you enter the value from step 3 in response to the prompt “FIRST NUMBER (XXXX)?” on the administration telephone menu, the number is shifted to the appropriate slot.

————— *End of Procedure* —————

Example:

The first number in the numbering plan is 2200. If you want the first number in the numbering plan to be 2300, and the first line card is located in slot 6, you will carry out the following calculation:

- 1 Locate the first line card. Subtract 1 from the card slot number it is housed in.

$$6 - 1 = 5$$

- 2 Multiply the number obtained in step 1 by 16:

$$5 \times 16 = 80$$

- 3 Subtract this number from the first number in the numbering plan:

$$2300 - 80 = 2220$$

- 4 Enter this value in response to the “FIRST NUMBER (2200)?” prompt on the administration telephone:

FIRST NUMBER (2000)? 2220

Removing numbering plan interferences

This section contains various methods of removing any numbering plan interferences that may occur.

Interference with Meridian Mail data

The Option 11 system is shipped with pre-programmed data to support a Meridian Mail card option. The pre-programmed Meridian Mail data may cause problems in the following situations:

- there is a numbering plan conflict with pre-programmed Meridian Mail data and the programming required for another feature
- card slot 10 is required for another circuit card.

Obtaining the use of card slot 10

If card slot 10 is required for another circuit card, simply remove the six Meridian Mail agents programmed for this card slot. To do this, load LD 11 on the TTY and respond to the system prompts as shown below. Repeat the procedure once for each of the six units that you want to remove.

LD 11

REQ OUT <CR>

TYPE 2008 <CR>

TN 10 XX <CR> “XX” = a value of 0,1,2,8,9, or 10

Obtaining the use of Meridian Mail ACD queues

The Meridian Mail feature also uses a number of ACD queues in the Option 11 system. Refer to the section of this chapter called “Interference with ACD queues” for information on how to remove this data from the system.

Interference with ACD queues

The Option 11C has pre-programmed ACD queues for Meridian Mail, the Central Answering Position, and general purpose ACD. (For some countries, pre-programmed ACD queues are listed in “Important extension numbers” on page 294.) To remove these values, use LD 23.

Note: Before you remove this data from the system, make sure that all ACD agent information is removed from the queue.

In LD 23, respond to the prompts as follows:

LD 23

REQ OUT

TYPE ACD

CUST 0

ACDN XXXX “XXXX” = Value of ACD queue

Repeat for each ACD queue you wish to remove.

Interference with Call Park extension numbers

System call park extension numbers are pre-programmed for the Central Answering Position. (For some countries, the default call part extensions are listed in “Important extension numbers” on page 294.) To remove this data from the system, load LD 50 and respond to the prompts as follows:

LD 50

REQ OUT

TYPE CPK

CUST 0

SPDN XXXX “XXXX” = Value of Call Park extension

Repeat for each Call Park extension you wish to remove.

Interference with SDI ports

Five SDI/ESDI ports are pre-programmed on the Option 11 system. Ports 8 and 9 are associated with the Meridian Mail card option, and ports 0, 1 and 2 are associated with the NTDK20 Small System Controller (SSC) card. Port 0 is associated with SSC card and cannot be removed. Any of the remaining ports can be removed using LD 17 as follows.

LD 17

REQ CHG

TYPE CFN

ADAN OUT TTY X “X” = the TTY that you are removing.

Interference with the SPRE code

If the pre-programmed SPRE code interferes with the programming required for the Option 11 system, use LD 15 to remove it. (For some countries, the default SPRE access code is listed in “First digits” on page 293.) For customer 0 enter the following in response to the SPRE prompt:

LD 15

SPRE Xy “y” = the value of the SPRE code

Note: To define a new SPRE code, type a space and enter the new number.

Interference with the attendant extension number

You cannot remove the attendant extension number entirely from the Option 11 system data; you can only replace it with another number.

LD 15

REQ CHG CHG = Change

TYPE CDB CDB = Customer Data Block

CUST x “x” = Customer number

.

ATDN xxxx “xxxx” = the new extension number

Changing or removing the pre-programmed night number

For some countries, the default value of the night number is listed in “Important extension numbers” on page 294. If you wish to change or remove the night number, use LD 15.

LD 15

REQ CHG CHG = Change

TYPE CDB CDB = Customer Data Block

CUST x “x” = Customer number

NIT1 bbbb, or X aaaa “bbbb” = the new extension number (DN)

Or

“aaaa” = the current night number
(the night number is now removed).

Interference with Flexible Feature Codes

If the pre-programmed Flexible Feature Codes interfere with the programming required for the Option 11 system, use LD 57 to remove the data from the system. (For some countries, default FFCs are listed in “Flexible Feature Codes” on page 298.)

LD 57

To change one or more access codes, type in the following commands:

REQ	CHG, END	Change or end
TYPE	FFC	FFC = Flexible feature codes
CUST	0-31	Customer Number
FFCT	YES,(NO)	FFC Confirmation tone
CODE	aaaa	Enter access code prompt (aaaa)
AAAA	xx	Enter the new access code prompt (AAAA)
CODE	<CR>	Return to REQ
REQ	END	End program

To remove one access code, type in the following commands:

REQ	OUT	Action request
TYPE	FFC	FFC = Flexible feature codes
CUST	0-31	Customer Number
FFCT	YES,(NO)	FFC Confirmation tone
ALL	NO	Remove specific access code
CODE	aaaa	Enter access code prompt (aaaa)
AAAA	xx	Enter the new access code prompt (AAAA)
CODE	<CR>	Return to REQ
REQ	END	End program

To remove all access codes, type in the following commands:

REQ OUT	Action request
TYPE FFC	FFC = Flexible feature codes
CUST 0-31	Customer Number
FFCT YES,(NO)	FFC Confirmation tone
ALL YES	Remove all access codes
CODE<CR>	Return to REQ
REQ END	End program

Creating, changing, and removing model telephones

If you need a model telephone different from the default models provided in Option 11C software, use overlays to design your own models using the information in the following table:

Table 88
Design your own models

Task	Overlay
Create your own model telephones:	
Analog telephones (500/2500 type telephones)	LD 10
Digital telephones	LD 11
Get information on model telephones	LD 20 (printout)

If you require additional assistance when creating your own model telephones and trunks, refer to the Option 11C *Software Input/Output guides* that are shipped with every system.

Creating analog telephone models

The following information must be entered in LD 10 in order to create an analogue (500/2500- type) telephone model:

LD 10

REQ NEW

TYPE 500 M

MODL YYY “YYY” = the model number of the
telephone that you are creating

Enter responses to the remaining prompts in order to complete the new model. (Refer to the Option 11C *Software Input/Output guides* for a complete list of prompts and possible responses).

Modifying analog model telephones

If you want to modify an analog telephone, use LD 10 and type in the following commands on the TTY:

LD 10

REQ CHG

TYPE 500 M

MODL YYY “YYY” = the model number of the telephone that you are
modifying

For more information about LD 10 and its associated prompts and commands, refer to the *Option 11 Software Guides* that are shipped with the system.

Creating digital model telephones

When you create model telephones for digital telephones, you must program key 0 with a function that can act as a prime extension number or its equivalent. This includes telephones that are programmed to have Single Call Ringing (SCR), Multiple Call Ringing (MCR), Single Call Non-Ringing (SCN), Multiple Call Non-Ringing (MCN), and Automatic Call Distribution (ACD).

For ACD telephones, the model telephone defines the ACD queue. To define the extension number, you must enter the ID number of the agent or the Central Answering Position.

The following information must be entered in LD 11 in order to create a digital telephone model:

LD 11

REQ NEW

TYPE 2XXX M or 3000 M “XXX” = allowed telephone types

MODL YYY “YYY” = the model number of the telephone that you are creating (between 1 - 127)

Enter the responses to the remaining prompts in order to complete the new model. (Refer to the Option 11C *Software guides* for a complete list of prompts and possible responses).

Modifying digital model telephones

If you want to modify a digital telephone, load LD 11 and type in the following commands on the TTY:

LD 11

REQ CHG

TYPE 2XXX M or 3000 M “XXX” = allowed telephone types

MODL YYY “YYY” = the model number of the telephone that you are modifying

For more information about LD 11 and its associated prompts and commands, refer to the Option 11C *Software Input/Output guides* that are shipped with the system.

Printing model information

To print information about model telephones, use LD 20.

Analog telephones

LD 20

REQ PRT

TYPE 500 M

MODL YYY “YYY” = the telephone model number.

If you want to print all of the models for
this telephone type, leave this value blank.

Digital telephones

Note: To print M3000 telephone models, you must enter “TYPE 3000 M”. If you enter “TYPE 2XXX M”, you print all the Meridian Digital Telephone models except the M3000.

LD 20

REQ PRT

TYPE 2XXX M or 3000 M “XXX” = the telephone type

MODL YYY “YYY” = the telephone model number

(between 1 - 127) If you want to print all
of the models for this telephone type, leave
this value blank.

Removing model telephones

Use LD 10 to remove analog telephone models and LD 11 to remove digital telephone models. Respond as follows to the prompts in either overlay:

LD 10 or LD 11

REQ OUT

TYPE XXXX M “XXXX” = telephone type for the model
you are removing (Example: 500, 2006,
2317, 2216, 3000, etc.)

CUST 0

MODL YYY “YYY” = the model number associated
with the telephone type you are removing
(Valid range is 1-127).

Creating model trunks and changing route access codes

If you need a trunk that is different from the default models provided in Option 11 software, use overlay 14 to design your own models. Route access codes are changed using the administration telephone.

If you require additional assistance when creating your own model telephones and trunks, refer to the Option 11C *Software Input/Output guides* that are shipped with every system.

Creating model trunks

To create a new model trunk, load LD 14 and type in the following commands on the TTY:

LD 14

REQ NEW

TYPE aaa M “aaa” = the type of trunk that you are creating (TIE, COT, WATS, and so on).

MODL YYY “YYY” = the model number of the trunk that you are creating (between 1 - 127)

XTRK XUT, XEM, XCOT, This prompt only appears when you XDID define the first model in a group. Each group consists of 16 consecutive model definitions. (Refer to the group boundaries listed below.) Once the first model in a group is defined, the remaining model numbers in the group(s) are assumed to be of the same type.

Group boundaries are as follows:

1-15, 16-31, 32-47, 48-63, 64-79, 80-95, 96-111, 112-127.

Examples:

If, for example, you define a model trunk as XUT, with a model number of 12, all models in the group 1-15 will automatically be XUT models. If you define another model trunk as an XEM, with a model number of 33, all models in the group 32-47 will automatically be XEM models.

Note: When you create trunk models you are not prompted for the trunk route or member number. This information is defined by using the administration telephone to program the XUT or XEM circuit card.

For more information about LD 14 and its associated prompts and commands, refer to the Option 11C *Software Input/Output guides* that are shipped with the system.

Modifying model trunks

If you want to modify a trunk, load LD 14 and type in the following commands on the TTY:

LD 14

REQ CHG

TYPE aaa M “aaa” = the type of trunk that you are modifying

MODL YYY “YYY” = the model number of the trunk that you are modifying (between 1 - 127)

Removing model trunks

To remove a trunk model from the system, load LD 14 and respond to the prompts as follows:

LD 14

REQ OUT

TYPE XXX M “XXX” = the trunk type of the model that you are removing (Examples: COT, TIE, DID, FEX, WAT, etc.)

CUST 0

MODL YYY “YYY” = the model number associated with the trunk type you are removing (Valid range is 1-127).

Printing model information

To print information about model trunks, load LD 20 and type in the following commands on the TTY:

LD 20

REQ PRT

TYPE TTTT M “TTTT” = the trunk type

MODL YYY “YYY” = the model number. If you want to print all of the models for this trunk type, leave this value blank.

Changing a route access code

Use this procedure to change a route access code.

Procedure 53

Changing a route access code

- 1 Pick up the handset of the administration telephone.**
- 2 Enter the administration Flexible Feature Code to access the administration menu. (For some countries, this value is listed in “Flexible Feature Codes” on page 298.)**
- 3 Enter the default administration telephone password. (For some countries, this value is listed in “Passwords and codes” on page 292.)**

You hear special dial tone and the prompt
“TASK?”

appears on the top line of the character display. If you press the asterisk, “2 CHANGE ROUTE ACCESS” appears on the second line of the character display.

- 4 Select “2 CHANGE ROUTE ACCESS” by entering the number “2”.**

The prompt
“ROUTE ACCESS?”
appears on the character display.

- 5 Enter the access code of the route to be modified and press the pound key (#).**

The prompt
“NEW ACCESS CODE?”
asks you for a new access code for the route.

6 Enter the new access code and press the pound key.

The display shows

“CODE CHANGED”.

After a delay of approximately 4 seconds you hear special dial tone and the sequence is repeated when the prompt

“ROUTE ACCESS?”

appears.

OR

If the route access code is not available for use, you hear overflow tone.

The display shows

“USED, ROUTE ACCESS?”

and you must repeat this step.

You must enter a **different** access code. This sequence continues until you enter an appropriate new access code.

7 Terminate the sequence by hanging up the telephone.

OR

Repeat the sequence by going through the steps again.

————— *End of Procedure* —————

Chapter 24 – Expansion cabinet as a power shelf for auxiliary processors

General information

This chapter contains the procedure for adding a cabinet to be used as a stand-alone power shelf for Aux processor units (such as Max IPE).

Expansion cabinet used as a power shelf

Follow this procedure to add an expansion cabinet used as a power shelf for auxiliary processor units.

Procedure 54

Expansion cabinet as a stand-alone power shelf

- 1 **Locate the carton containing the expansion cabinet. Install it as described in “Chapter 9 – Mounting the cabinets” on page 103.**
 - Make sure that it is mounted according to the plan.
 - Make sure that it is securely mounted.
 - Make sure that the pedestal is properly installed if the cabinet is to be mounted on the floor.
- 2 **Make sure that the AC power cord is disconnected from the power outlet.**
- 3 **Install a #6 AWG (# 40 Metric Wire Gauge) ground wire from the cabinet to a ground source (the ground bus in the AC power service panel).**

Note: Do not connect the ground wire to the ground connection in an existing Option 11C cabinet. The ground wire must be connected to the ground source.

WARNING

The connection in the AC power service panel should be performed by a qualified technician or electrician.

Connect the ground wire to the ground lug located in the bottom of the cabinet next to the cable connectors.

Route the ground wire through the third groove from the left in the bottom of the cabinet.

Connect it to the Single Point Ground (SPG) and place a DO NOT DISCONNECT tag on it.

Note: Refer to the Option 11C “Grounding requirements” on page 39.

- 4 **Put on the wrist strap provided in the bottom of the cabinet and install the power supply with the circuit breaker at the OFF position. If this is an AC powered system, plug in the power supply cord in the commercial power supply receptacle and into the power supply. Refer “Chapter 11– Installing the power supplies” on page 119.**

CAUTION

A grounded wrist strap, provided with the cabinet, must be worn when handling circuit cards to prevent damage caused by static electricity.

- Make sure that the NTDK78 AC/DC or NTDK72 DC power supplies are installed and that their circuit breakers are set to OFF.
- 5 **Refer to the ACD Max documentation to complete the installation of the Max units and related cables.**
 - Connectors for the cables in the expansion cabinet are located on the panel below the cabinet's shelf. Refer to “Chapter 13 – Installing and connecting cross-connect terminals to cabinets” on page 147.
 - for information about connection cables to the cabinet.

Note: The slots in the expansion cabinet are labeled 1 through 10. The corresponding connectors for cables are labeled J11 through J20 or J1 through J10, depending on the type of cabinet.

----- *End of Procedure* -----
